Yahoo Group summary: N2ADR-SDR / HiQSDR Transceiver

These Yahoo Groups messages were archived in WARC format by ArchiveTeam in 2018. This PDF was generated by Digital Library of Amateur Radio & Communications from the WARC files in 2026.

Date span: 2011-01-28 through 2018-08-02

Source WARC: n2adr-sdr.W863xYW.warc.gz

Source item: https://archive.org/details/yahoo-groups-2018-09-05T20-23-04Z-0a8f9c

Messages included in this PDF: 2547

Yahoo replaced the domain portions of email addresses with @... in the archived messages. Characters lost in Yahoo's archived text appear as ?.

Messages are presented in ascending Yahoo message-ID order. Gaps indicate records absent from the source WARC or messages omitted from this PDF as spam.

15. This group...

Yahoo group: n2adr-sdr
Date: 2011-01-28 20:44:04 UTC
From: Mario
Topic: 15 Message: 15

Dear all,

due to an "accident" the messages in this group were deleted. Fortunately there was not too much information in there ;)

So i post the most important information again:
This group is about the fully digital transceiver designed by Jim, N2ADR. This frontend uses direct A/D to sample the RF spectrum between DC and 60MHz and D/A conversion to generate RF signals.

The frontend can directly interface with quisk which is also developed by N2ADR.

Jim published all the design data and the sourcecode for free usage.
DL7LA and DL7IY did experiments with Jims design and published an article in the german "Funkamateur" 10/08.
Helmut, DB1CC did a complete new design of the PCB with 4 layers which should make reproduction more easy and stable.

This group should be used to share knowledge about the design and help with the bringup.

There are informations about the DL7LA/DL7IY board which can be used to get an overview how the complete things work together.

Helmut will publish his design as well. Some layout screenshots are already available in the files section.

Please feel free to tell your questions.

16. Group for german language discussions created.

Yahoo group: n2adr-sdr
Date: 2011-01-28 21:02:05 UTC
From: Mario
Topic: 16 Message: 16

Since there are several people who prefer to discuss on this topic in german language i created a second group "n2adr-sdr-deutsch".
If there are discussions of publich interest i will translate the most important information and post it here.

regards
Mario, DH5YM

17. HiQTRX Board has arrived!

Yahoo group: n2adr-sdr
Date: 2011-01-29 12:36:22 UTC
From: Helmut Goebkes
Topic: 17 Message: 17

Hello Group!

The 1st Board of the HiQTRX has arrived! I have posted a
photograph of the Board to the files group.
I will assemble and test the board next few days and
keep you informed!

Helmut, DB1CC

Hi Dominik,

the DL7LA/DL7IY PCB can be ordered at www.hofmannlp.de.
You need the name of the PCB project: "Transceiver_iy", and the archivenumber: "134948".
Be aware that this is the PCB that is similar to the original N2ADR PCB design.
See http://www.mydarc.de/dl7la/ (in german language). Tell me if you need further help there.

The PCB from DB1CC Helmut is not available yet since it is in prototyping stage.
My recommendation would be to wait for this new PCB, but it is up to you.

regards
Mario

20. new version of QUISK

Yahoo group: n2adr-sdr
Date: 2011-02-15 20:00:02 UTC
From: Mario
Topic: 20 Message: 20

```
Hi,

Jim released a new version of quisk.

Copy and paste from the changelog:

-------------
Quisk Version 3.5.1 February 2011
================================
The phase correction control has been improved to allow multiple correction
points per band. Unfortunately this will require re-entering corrections.

I added mic_preemphasis and mic_clip to the config file to control Tx audio processing.
----------------

regards
Mario
```

21. HiQSDR Board assembled and partially tested!

Yahoo group: n2adr-sdr
Date: 2011-02-19 17:43:15 UTC
From: Helmut Goebkes
Topic: 21 Message: 21

Hi group

(you will find the pictures of the board in the 'files' area)

i got some time to assemble the board an make some pretests
on power, sequencing, RF preamplifier and network - seems to be ok.
Power consumtion is currently 400mA / 6V, but there is nothing in the FPGA so the consumption will rise if FPGA is running at full speed;-))
The power sequencing seems to functional correctly, i did not found any latch-up of the ADC.

Now its time to syntetisize the Verlog Program from N2ADR and load it
in the FPGA next days....

Btw: Normally i solder such boards in my Reflow oven, but to test the
solderability for hand solder users, i do this job for this
Prototype board by hand. I had no problem at all, the 0603 R / C are
no problem, thanks to a little oversized Pads for these Parts i used.
"Most Fear" Chip, the 240-pin FPGA is VERY easy to solder, i need
just 12 Minutes to solder it and hab to remove just 2 solder bridges.
A good experienced Worker can assemble and solder the board in five to six hours.

73 de Helmut, DB1CC

23. Code for ALTERA FPGA

Yahoo group: n2adr-sdr
Date: 2011-02-20 19:33:02 UTC
From: Yogy San
Topic: 23 Message: 23

Dear All,

Please tell me where i can find the code for the FPGA .
I have found only schematics and some pictures of the PCB.
It looks that is a very nice design but without the code for the FPGA the experiments and future research is stopped.
To start everithing from scratch is more complicated than worth and i belive there is a way to get the code and make future development using someting that is already working.

Have a nice day ,
Cristian

Topic: 23 Message: 24

Hi Christian,

the FPGA sources are linked on N2ADR's page:
http://james.ahlstrom.name/transceiver/fpga.zip
(Just a tiny small link)

The design is written in Verilog.
Helmut already did a number of changes.

regards
Mario

From: Helmut Goebkes
Topic: 28 Message: 28

Hi group,

just before some minutes i got the first lifesign from the new HiSDR-Prototype. The board answers correct to a ping @ network address 192.168.2.196 ;-)) Seems that up to now the FPGA & LAN Part is working correct.

Now i have to configurate QUISK and start testing with QUISK...

73, Helmut, DB1CC

33. LNA oscillation problems with DL7LA PCB

Yahoo group: n2adr-sdr
Date: 2011-02-27 17:39:39 UTC
From: Mario
Topic: 33 Message: 33

i am facing some serious oscillation problems with the original DL7LA/DL7IY PCB that i am still not able to fix.
I get a strong gaussian shaped noise on several frequencies e.g. 15, 30, 45... MHz that moves somehow with temperature of the circuit. The noise vanishs if i touch the LNA section with my fingers.
I already managed to relax the problem a bit by moving the ground pads of the capacitors of the filter at the output of the LNA to one side (away from the power supply filter) and i added 10pF before the 50Ohm series resistors. For a while i thought this solved the problem but now it is back again. Has anybody else seen this effect also ?
My assumption is that it is a oscillation of the LNA because of insufficient grounding but probably i am wrong.

In addition i uploaded some screenshots to the file section that show
different bands received here. They do not have anything todo with my "noise problem".

regards
Mario

From: Helmut Goebkes
Topic: 33 Message: 34

Hi Mario,

maybe the oscillation problem comes from a unsufficient GND-connected exposed Pad of the LNA. I had similay problems a year ago with a analog devices differential OpAmp.

hope this is helpful...

73!
Helmut, DB1CC

36. HiQSDR SSB Transmission is working

Yahoo group: n2adr-sdr
Date: 2011-03-03 08:09:56 UTC
From: Helmut Goebkes
Topic: 36 Message: 36

Hi Group,

with the windows version of Quisk a had a lot of problems producing SSB TX signals, because of sound errors. Jim (N2ADR) wrote, that the windows version is "Alpha", so i tried HiQSDR Hardware to operate with QUISK 3.5.1 in the LINUX Version and it works as RX without any sound problems.
As i have no experience with Linux, a friend of mine (DG7MGY, Hubi) a LINUX Expert, helped me yesterday to solve some problems defining the correct sound input for Quisk TX operation. After fiddling with some variables in the config.py (especially trying to find the correct PTT activation for SSB transission..), QUISK and HiQSDR works perfectly together. I had no problems to receive 960kHz of Bandwith without any interruptions and to produce a good quality SSB transmission. Next few days i will measure the transmission paramaters (IMD, SN a.s.o) of HiQSDR. I am very shure, that all is ok now and the project is nearly done (from my side ;-))

Quisk is working fine but lacks some features which (in my opinion) are important. Quisk should have a "zoom" facility for the Graph/Waterfall because some signals are too small(PSK, CW, faint signals) to be seen even in the smallest Bandwidth of 48KHz) and the Filter bandwith should be interactive adjustable down to (at least) 50Hz to improve receiption of very faint signals (like "Whisper", WSJT or similar) - lets see whats going on @ the community :-)

73 de Helmut, DB1CC

Congrats on reaching another milestone.
Interesting remarks on quisk. In earlier versions, the softrock40 group
had add-ons such as IMD measurement, IQ Balance and IQ Calibrate which
with James' help we couldn't get to work with later versions.

Hello Helmut,
Well done on getting the board going, sounds like a great success.
Looking forward to hearing more about your progress. Do you plan to make any test measurements?

You mentioned about Quisk. I have been trying it with my softrock setup and find that it works really quite well but as you say does not (yet) have the bells and whistles of other software.

What would people think to making the board compatible with other software (hope I haven't spoken out of turn here!!) that is out there that already has the goodies? Of course we would need someone with the FPGA skills to code the firmware and another to mod the software:).

39. Software compatibility - was Re: HiQSDR SSB Transmission is working

Yahoo group: n2adr-sdr
Date: 2011-03-07 14:49:52 UTC
From: Marciniak, Ed
Topic: 36 Message: 39

It shouldn't be difficult to create a windows service or unix daemon to bind a udp port to listen, one to send, and start a thread with a high resolution event triggering execution on a set of code to move the data. Slight alterations to the timing interval could be used to maintain half full receive buffers. The resulting streams could be stripped of their headers and freframed as if they were coming from a janus/ozy HPSDR interface and sent to PowerSDRwith a dll publishing same interfaces. At sample rates ASIO would accept, perhaps one could apply the same concept to provide an 'audio' path there.

I've not had enough time to play in the Linux world for quite a few years, but I'd imagine the same sort of thing could be done there.

With either, some hacking of the sdr software might be necessary to support sample rates >192ksps.

Do I have time to do the above? Unfortunately not quite yet, and I don't have hardware in hand either....

The biggest bummer might be retiming 48khz audio to exactly match an integer multiple of the sample rate when it has a differnt clock source. The TAPR HPSDR people made a wise choice in including an ADC/DAC for mic and speaker, driven off the sample clock which neatly sidestepped that problem. Having an SDR that provides the design assuption of synchronous sampling for inputs and outputs eliminates the need for resampling or otherwise dealing with small clock rate differences. It also potententially simplifies the software in that the the same fft and inverse fft, fir and other code might be used for both input and output. That results in tighter code that has less cache turnover which boosts cpu performance.

I just joined the group yesterday after reading the QEX article so what I'm about to ask might be redundant....

Why choose a 14bit TI ADC, when potentially there are 16bit parts out there from multiple vendors that are similarly priced or in some cases actually cheaper?

Does anyone have PCBs available, or partial/complete kits?

Slight alterations to the timing interval could be used to maintain half full receive buffers. The resulting streams could be stripped of their headers and freframed as if they were coming from a janus/ozy HPSDR interface and sent to PowerSDRwith a dll publishing same interfaces.

YM: yes, this would be an alternative for windows. But why not concentrating on getting QUISK stable for Linux and Windows ? I like the open source aspect of such projects. I know QUISK currently lacks many features that are necessary for real operation but keep in mind at this stage only N2ADR is working on it. It is quite good for a one-man show. But why not creating an interface driver if someone has time for that.

> At sample rates ASIO would accept, perhaps one could apply the same concept to provide an 'audio' path there.

YM: Indeed. Getting Mic Audio and putting RX Audio would be a nice feature for the future. On the other hand this board is just the frontend and not a complete transceiver. The baseband coder/decoder would be an own component either. There are several conditions were you want to process your audio to another software via an virtual soundcard for example.

>
> I've not had enough time to play in the Linux world for quite a few years, but I'd imagine the same sort of thing could be done there.
>
> With either, some hacking of the sdr software might be necessary to support sample rates >192ksps.
>
> Do I have time to do the above? Unfortunately not quite yet, and I don't have hardware in hand either....
>
> The biggest bummer might be retiming 48khz audio to exactly match an integer multiple of the sample rate when it has a differnt clock source.

YM: I do not know if/how N2ADR did this until now but since he also supports the IQ-SDR hardware i assume he does a audio sample rate correction. I guess this should not be too difficult but needs some care not to cause problems with digital transmission modes when skipping samples or playing them twice to tweek the sample frequency.

> The TAPR HPSDR people made a wise choice in including an ADC/DAC for mic and speaker, driven off the sample clock which neatly sidestepped that problem. Having an SDR that provides the design assuption of synchronous sampling for inputs and outputs eliminates the need for resampling or otherwise dealing with small clock rate differences. It also potententially simplifies the software in that the the same fft and inverse fft, fir and other code might be used for both input and output. That results in tighter code that has less cache turnover which boosts cpu performance.

YM: CPU performance might be a point. But is it really a issue today ?
Probably if you want to use a laptop as baseband.

>
> I just joined the group yesterday after reading the QEX article so what I'm about to ask might be redundant....
>
> Why choose a 14bit TI ADC, when potentially there are 16bit parts out there from multiple vendors that are similarly priced or in some cases actually cheaper?

YM: Regarding the ADC you have to consider all the parameters like max sample rate, SFDR, SNR, noise distribution over bandwith...
Since this concept samples with 120MHz and does filtering and decimation afterwards you gain resolution anyway. Probably this ADC is not the optimum but it is available. If you have some experience in this field you can give some suggestions. Even the 14bit resolution you need to get in a real design and over the full frequency range ;)

>
> Does anyone have PCBs available, or partial/complete kits?

YM: Helmut just finished the prototype of his PCB and he told that he wants to do a few changes and release the PCB afterwards. I do not know whats his actual plan. Probably you can buy a PCB at him or probably you can take the Gerber data to your local PCB vendor. I do not know currently. Creating a Kit here in Germany could be a bit difficult since most of the parts have to be ordered from Digikey.
Probably someone can create a package with the parts that are hard to get.

> >What would people think to making the board compatible with other software (hope I haven't spoken out of turn here!!) that is out there that already has the goodies? Of course we would need someone with the FPGA skills to code the firmware and another to mod the software:).Andrew

YM: yes it is difficult to have one that can really do all the stuff from FPGA to the PC software. I think thats only possible in a group.
As i understood Helmut already did a few changes to the verilog code from N2ADR.

41. TX Measurment on HiQSDR / Where will we go?

Yahoo group: n2adr-sdr
Date: 2011-03-08 08:49:01 UTC
From: Helmut Goebkes
Topic: 41 Message: 41

Hi Group,

you can find some measurements on TX output of HiQSDR in the
HiQSDR files area. All values are noted in the screen shots
of my HP Spectrum Analyzer.

Some minor layout changes are done and will be completed this week. Then i upload the newest files to the groups file area to make
it available. The partslist as well as the BOM is currently in work by DG3MDE and will soon be completed, also some building hints & pictures.
My "project target" is a complete HiQSDR-TRX, but its a lot of work just for one man so i hope to get some help from the group in design and ideas & suggestions.
Currently André DL6AST has developed a 100W-PA wich is in Prototype stadium and will be tested soon @ my Lab.
Automatic preselection/Preamp/Driver Board is currently under construction and will be available in about 4-6 Weeks.

So more orders for the HiQSDR PCB we have, the PCB will be cheaper for all. All boards are professional 4-Layer, gold plated, electrically tested board.

To sell Boards as part or as whole is possible but i have to do this via my company because of the german law
(if you sell more than one, you are a commercial reseller)
and the financial auhorithies are knocking on your door...

Also i have to contact N2ADR because its a non-commercial development and this status should be kept for the full HiQSDR-TRX project.

I will offer PCB-Boards and (SMD) preassembled HiQSDR boards and
-if there is enough request- complete professional built boards
or Kits as well.

i`ll keep you informed!

btw: personally, i think N2ADR has done the right decision to select a quit 14-Bit ADC instead a 16-Bit ADC. To achieve full 16 Bit resolution at high frequencies, is much more challenging than in "normal" measurement like temperature loggers or so which is tricky enough.
What do you gain from a 16-Bit ADC, if the last two bits are always
flickering at random noise? - give yourself an answer....
It is much better to have a stable 14-bit signal than a noisy 16-Bit one...

Hi,

take care: It is for the PCB design from N2ADR with modifications by DL7LA/DL7IY. It is not valid for the PCB from Helmut DB1CC because he has some additional parts on his PCB.

regards
Mario

49. LNA oscillation problems with DL7LA PCB

Yahoo group: n2adr-sdr
Date: 2011-03-15 07:44:40 UTC
From: Mario
Topic: 33 Message: 49

Hi all,

this morning i had some success getting the oscillations of the LNA on my DL7LA/DL7IY PCB under control.
Previous experiments with changed ground routing, resoldering the preamp and capacitors at the output were not very satisfying.
Just for test i now soldered 50pF at each input of the LNA stage behind the 100Ohms series resistors (seen from the transformator).
Now the oscillation has vanished. I did not look at the influence of these caps to the frequency response of the input. I assume it is only small. Probably also lower values will work for the caps.
I was only able to get around -115dBm noise level display. In that sense Helmuts new Layout already is a good improvement.

regards
Mario

50. output spectrum at my DL7LA PCB

Yahoo group: n2adr-sdr
Date: 2011-03-17 19:12:55 UTC
From: Mario
Topic: 50 Message: 50

Hi,

yesterday i brought up the transmitter section of my DL7LA/DL7IY PCB. I use a NXP MMIC BGA6589 but the bias current is much too low (around 40mA) at the moment. I think thats the reason why i get poor IMD figures at the moment. The carrier plot looks rather good. Unfortunately the dynamic range of my measurement receiver is too small.

The 3 figures are stored in the files section in my folder.

regards
Mario, DH5YM

From: Mario
Topic: 50 Message: 51

Hi all,

today i did some more TX measurements on my transceiver frontend.
Before i changed the MMIC bias to nominal level (80mA).
I uploaded the pictures to the folder
http://groups.yahoo.com/group/n2adr-sdr/files/DH5YM%27s%20folder/7IY%20PCB/
The picture names state the TX frequency, the modulation and additional information. E.g. 28M_IMD-6 means 28MHz, IMD test with software set attenuation -6dB.
I was hoping that the IMD would be a bit better but i have no comparison if this is ok.

Some interesting things if found:
- at low frequencies (below 40m) the output signal looks really good.
- at higher frequencies the wideband output looks significantly worse. It seams that there are several strong spurs from the clock generation. At 55MHz the signal is already really noisy.
- the overtones are really strong and lowpass filtering is mandatory ;)
- looking closer to the sine signal shows that there are symetric spurs around the TX frequency (around +-50kHz).

So there is still much to investigate and probably to improve.
Comments ? Suggestions ? Questions ?

regards
Mario

Hi Mario,

i´ve made some new measurements today with a high dynamic measuring receiver to get more informations about the TX signals.
I uploaded the screenshots in the HiQSDR file area.
unfortunately the maximum measuring frequency possible was just below 50MHz, so i checked the cw carrier at 45Mhz but found - different to your measurings - only a slight degradation compared to the TX signals @ lower frequencies.
I also cannot find any spurs far away from the carrier like the 5/10khz spurs you found, i agree this might be residuals from the your power supplies wich may oscillate.
The only spurs in the signals i found are 100Hz from the carrier - maybe inducted (and doubled) from the 50Hz mains...

I also added actual IMD3 measurings. All Signals are fed into the Measuring receiver via a 60dB precision attenuator.

BTW Mario: Have a look above 100Mhz to 1GHz, you will be surprised finding many spurs and overtones from the 122.88MHz main clock.
In my HiQSDR redesign, i added a 7-pole 70 MHz Cauer LP-Filter directly between ADC output transformer and the MMIC driver to kill those unwanted signals...

Topic: 50 Message: 53

Hi Helmut,

thank you very much for the measurements.
Yes indeed. The problems i saw seem to belong to my PCB only.
But i think thats really good news.
I will crosscheck with the signal directly out of the FPGA.
Probably you can check a few MHz up and down for some spurs that may appear but i assume you already did.
I will check the frequencies above 50MHz to 1GHz. The receiver i can use can operate up to 3GHz.
I think crosschecking the same design in two different implementations is a really interesting thing since you can easily see which problems can be solved by a good layout.
I am really excited for the release of your PCB...

regards
Mario

Hey Dale,

just have a look to the Files Section. There is a file with a partlist for this PCB. Assembly data you should extract out of the eagle design. Probably you have some more detailed questions later on.

So, is there anyone who has an extra pcb, or wants to add one or two to a few they're running soon? I'm interested in getting hands on some hardware.

Hi Andrew,

the plots were captured with a commercial equipment from IZT (a spinoff from Fraunhofer) called R3301.
It is not a spectrum analyzer but a measurement receiver that can do realtime FFT over maximum 24MHz bandwidth.

regards
Mario

Hi Ed,

do you mean the DL7LA/DL7IY PCB or the PCB from Helmut,DB1CC ?
The DL7LA/DL7IY PCB ordering information is here:
http://groups.yahoo.com/group/n2adr-sdr/message/19

The PCB from Helmut is not ready for production yet (at least i did not hear anything from Helmut yet).

For the LA/IY PCB see my pictures in the files section first to get an overview how it could look like in the end.

regards
Mario

63. HiQSDR - Version 2 shortly available

Yahoo group: n2adr-sdr
Date: 2011-04-02 08:32:27 UTC
From: Helmut Goebkes
Topic: 63 Message: 63

Hi Group,

sorry for the little delay, but i was some days ill, so the work stopped for a while ;-((

I made all the changes with respect to the tests on HiQsdr
and the layout is ready. Also the BOM is nearly done, i will post the files next days.

Changes for HiQSDR V2:

1.) Pull-Down Restistor array to hold Attenuator RF2420 in
"switched THRU" if FPGA is not programmed for attenuator mode.

2.) protective diodes @ RF input changed to special RF protective,
low capacitive Zener-diode, bidirectional - gives much better IP on large signals by better protection.

3.) Discharge resistor added on input (220k) to discharge static voltages to ground (as found on long wire antennas)

4.)ADC and DAC are now selectable between normal "low-Noise 3.3V-Supply" and
Ultra-Low-Noise special supplies via solder bridges.
Test shows that at the resolution of the ADS5500 the extreme low noise supplies shows no relevant improvement, so the user have now the option to built and use the
Ultra-Low-Noise-Supplies or use the "normal" (filtered) 3.3V-Supplies.
Because the "normal" 3.3V Suppy is also a very low noise regulator, there is no real need to use the (costly) Ultra-Low-Noise suppy. But to give the user the chance to test by himself, the Ultra-Low-Noise supplies are optional assemblied for use on board.

5.) A 7-pole eliptic-cauer low-pass filter was added between the RF output transformer and the MMIC-Driver to avoid the output (and amplification) of unwanted residuals and overtone from mainly from the 122.88 MHz clock and its artifacts. The filter is calculated for a stop frequency of 70MHz LP to allow full operation of the enrire HiQSDR opration range.
The filter can also built up for lower (35MHz) cut off-frequency if one do not want to operate at 6m. All Parts are 0603 inductors and capacitors to help for easy and reproducable assembly.

Thats all folks, all other parts work as expected and there was no need for any other PCB change (thanks to a good real-time layout check software ;-))

I had some talks to my assemblers to have PCB assembly options, so shortly i can offer bare pcbs, pcb with semiconductor kits as well as full assembled and programmed/tested boards to fair costs.
The boards are professional (Aircraft quality) partíally gold plated 4-layer PCBs, electrically tested with solder stop and parts silk screened on both sides.
All semiconductor parts are original from the manufacturers, antistatic and anti-moisture packed ready for soldering.

Additionally i can deliver the cooling heat spreader mountable to the backside of the pcb, cnc milled, drilled and glass bead-matted, ready to mount. But every body can make this by his own, its a simple part made from 5mm Aluminium, some drills and 2.5mm taps. The CAD/CNC files will be availabe in some days here in the files area.

I will have all informations fixed in some days,
so please be patient.

73!
de Helmut, DB1CC

From: Marciniak, Ed
Topic: 67 Message: 67

It seems to me there is a local business in my area that will mount a couple BGA packages for a reasonable charge. It seems to me a friend of mine took a couple boards over than they charged something like $20 each to mount a bga package on a couple boards.

Although not exactly a first choice in terms of multilayer being mandatory, it is worth asking....
Could one save enough pcb area to have a reasonable cost on a run of perhaps 50 pieces?
Could one improve noise coupling enough to be worth it, or use a less expensive or more available part?

Hi, I certainly am a naive newbie here in the group, but I would like to add this info.

There is a fellow who lives near Columbus, OH N8WFF who owns "Dishtronics" and sells a very expensive and beautiful "Prometheus" Linear Amplifier. He has full SMT (BGA?) board production equipment and is looking for projects to do on the side. Perhaps he could be the kind of person you are looking for to help move this great project along?

70. I2PHD/I0CG SDT-2011 DUC Transmitter just announced

Yahoo group: n2adr-sdr
Date: 2011-04-06 03:11:05 UTC
From: KennethH
Topic: 70 Message: 70

I find the webpage very confusing: http://www.i0cg.com/sdr-x.htm
scroll all the way down to the bottom to find the new SDT-2011.

I asked Alberto I2PHD to help me understand it, and it seems to be a DUC transmitter that they hope to connect to existing DDC receivers such as the Perseus or RFspace units (?).

It will be shown at the Modena Italy Hamfest this weekend (April 9th). I hope some of our friends in Italy will get the inside story and let us know (in English) what it is all about. Is it the basis for a DDC/DUC transceiver?

I am also very eager to learn about the N2ADR/DB1CC/DL7LA experiments and working prototypes. I hope I live long enough to see an affordable Ham DDC/DUC transceiver :-)

thank you for reading my post and allowing me to participate in the group. I have added some links.

Hi Helmut,

i will ask around in the local club here.
What is your favourite way to collect the names who have interest in the PCB or a kit or a ready PCB ? Shall people send you an eMail or do you want to collect the information in the group ?

BTW: I agree about your comments about using 14bit ADC. The 16bit make just sense if you get the design so clean that you do not waste the LSBs. BTW also in commercial SDR designs there are most the time max. 14bit or less (Of cause there are usually frontends with gain control).

Hope i have some time to do some RX measurements next week with my PCB. I am especially interested in the noise with respect to frequency and how much dynamic range is lost due to the fact that the noise of the ADC increases with input frequency.

regards
Mario

This has been long in the discussions. I'd guess they still heavily focus on the RX line. Most of the customers I met in the Friedrichhafen fair last year were the BCL type. As long as one can get along with the shortcomings of USB that is a job very well done.

My prototype here has been performing so well that I am right now considering getting the professional version from Helmut (if a SMT ready mounted type is offered) as a backup for my shack. The idea behind this is getting rid of receptions problems (I live in the middle of a RF-polluted city) by moving the RX part to a quiet location and connecting to it via Internet services.

Hello, Mario,
at times I had the same effects. I cured them by placing a piece of high loss ferrite (EMC chokes on old video cables work fine) on each side of the LNA-to-ADC-connection area of the PCB. I guess with the circuit ground on Jim's layout you probably cannot do any better. Helmuts design will almost certainly be quiet, I'm sure.

Hi Saulo,

Helmut will ask around for people that are interested on weekend.
Most probably he will collect the requests via eMail.
Lets wait for his information about the process.

regards
Mario

From: Helmut Goebkes
Topic: 77 Message: 77

Hi Group!

Info for HiQSDR, Version 24t: (newset Version)

If anybody needs printed circuit boards, special parts kit or
fully built, soldered, tested and programmed HiQSDR Boards will find
all necessary Information @ the site

http://www.technologie2000.de/page5.php

Here you will find all informations and how to order.

73 de Helmut, DB1CC

78. new version of QUISK 3.5.2

Yahoo group: n2adr-sdr
Date: 2011-04-20 06:22:38 UTC
From: Mario
Topic: 78 Message: 78

Hi,

there is a new version of Quisk published by Jim:

Changelist:

"Quisk Version 3.5.2 April 2011
==========
I added code from Ethan Blanton, KB8OJH, to provide direct frequency control
of the Si570 chip in many SoftRocks. I added AM transmit and improved AM
receive. I added FM de-emphasis to receive. I added a noise blanker.

It is now possible to delay samples (tx_channel_delay) and correct the amplitude
and phase for the sound card play device (SoftRock transmit). Unfortunately
receive sound card corrections will need to be re-entered.

The filter bandwidths for each mode can now be set in the config file. And
you can right-click the right-most filter button to adjust its bandwidth."

regards
Mario, DH5YM

Hi all,

I tried with my N2ADR frontend this evening. The adjustable filter is rather cool. I have set it to 11kHz bandwith USB and fed the soundcard output to another PC running DREAM and was able to decode some DRM stations. The output spectrum looked a bit strange (some steps in amplitude over spectrum) but it worked.
I did not try much more so far.
Probably it is also possible to set down the decimation even further a bit to allow for higher bandwith. Probably one could use the samples for DAB broadcast radio decoding...
just some thoughts ;)

regards
Mario

85. [Q] T/R times with DB1CC/N2ADR Transceivers?

Yahoo group: n2adr-sdr
Date: 2011-04-21 23:21:53 UTC
From: Ken N9VV
Topic: 85 Message: 85

Hi, the SDR arena has been plagued with long delays
while switching from Receive to Transmit. Several
commercial unit have had people give up on CW because
they were unable to get the R/T time down below 80ms.

The ARRL testing of one Commercial unit showed that it
"did not meet the TOR specification" set by the ARRL at
20ms for the old AMTOR and PACTOR modes.

I have seen several comments about the T/R and R/T times
of the OpenHPSDR equipment as well. Phil VK6APH, has written
with great pride, that he generates the sidetone for CW
inside his FPGA in an effort to optimize the QSK capability
of his K.I.S.S. Windows GUI control code.

Does anyone have any idea what the DB1CC Transceiver boards
do with respect to T/R? there is precious little information
about the FPGA HDL code or any PC support code for WIN/LIN/MAC.

Here is what I found on his webpage:
DB1CC is selling boards, parts, or fully assembled units.
http://www.technologie2000.de/page5.php

--------------- Google Translation -------------
HiQSDR DDC SDR modules built, ready-to-use

Complete module "HiQSDR" main TRX module, complete built, Complete
module "HiQSDR" TRX module main complete, built,
soldered, tested and fully programmed, ready to use. soldered, tested
and fully programmed, ready to use.
incl. CD with all documents including CD with all documents
? 569.-- / St?ck / pcs ? 569th - / pc / pcs

Is that about $850 USD(?) I think there is no case or enclosure yet.

any comments yet? or is it still much too early and units have not yet
reached the U.S.?

thank you for your help in understanding what this beautiful DDC/DUC
unit is all about.

Hi Ken,

> Hi, the SDR arena has been plagued with long delays
> while switching from Receive to Transmit.

I know about this. Jim, N2ADR wrote QUISK for the purpose of QSK CW operation. The frontend is generating CW directly in the FPGA and the key is also connected there. The demodulator reacts also rather fast.
When i listened to my transmitted signal and my sidetone (generated at the PC) at the same time i was not able to hear a significant delay. I did not measure but i assume that it is below 20ms. This needs to be checked. It may depend on the PC hardware that is used.

> there is precious little information
> about the FPGA HDL code or any PC support code for WIN/LIN/MAC.

Just look to Jims website. You can download the complete Verilog code there. The Quisk software is currently for Linux and supports also Windows. Windows is far less tested i guess.
Connecting the Frontend to other software would also not be too difficult. I am documenting this currently but takes some time since i have little time currently.

> □ 569.--
This is including german VAT of 20%. I do not know if this has also to be paid by foreign customers. Just ask Helmut. The exchange rate is currently around 1.4, so this is not optimal for the US. Also think about the shipment cost.

I assume overall it is a nice project even if there is still much to do in order to have a full shortwave transceiver.
The boards provided by Helmut are just the first step to provide availability of the hardware and to bring more software developers and users into the project.

regards
Mario, DH5YM

O.K. yes Jims documentation gives a clear picture of how Quisk is designed for CW ops and QSK. This is really wonderful. I appreciate your clear explanation. Thank you very much for taking the time to help me understand how the package is currently working and what to expect.

mny tnx,

Helmut

are there any spec's posted for the receiver? MDS? SFDR? IP3?

thanks, 73, w5xz, dan

Hi Dan,

until now i think nobody has detailed measurements on the RX performance. N2ADR does some statement on the noise figure of his PCB (24dB). In lowest decimation you get a bottom noise level of around 120dB below A/D clipping.
DL7IY and DL7LA stated the following measurements with their PCB:
MDS((S+N)/N=3dB)=-122dBm at 7MHz
Birdies less than -110dBm
IP3 at 7MHz with 10kHz offset: +26dBm

I try to measure such stuff as well next time for my DL7LA/DL7IY PCB.
It is probable that Helmuts PCB will give somehow better results.
My assumption is that the performance will degrade slightly on the higher bands since the A/D converter noise is not equally distributed over frequency.

regards
Mario

mario

thanks. i was thinking the 4-layer board might have better performance than the initial 2 layer printed circuit board.

thinking about collecting parts here in the states, and taking shot at assembly with re-flow soldering in a toaster oven....at least for the larger chips...

Hi Dan,

yes, i also assume that the 4-layer board has probably better performance due to reduced noise.

Probably Hans has already some results ?

It is not said that all things of the design are already optimal. Probably improvements are possible in the LNA section and most probably there are also things to improve in the FPGA internal design.

Helmuts PCB is a great and necessary step into the direction to get a reproducible and performant frontend.

regards
Mario

Great Question Dan.

There are so many different programs out there right now it is totally amazing :-)

Perseus Software (Microtelecom)
GNUradio
QUISK (http://james.ahlstrom.name/quisk/)
HiQSDR
HDSDR (formerly WinradHD)
WinRadF
WinRad (Alberto I2PHD)
SDRradio (Alberto I2PHD)
SDRMAXII/III/IV (QuickSilver Project N8VB)
Panoptos (QuickSilver Project Ms. Cathy Moss - UK)
K.I.S.S. (OpenHPSDR vy VK6APH)
Heterodyne MAC for OpenHPSDR (Jeremy McDermond NH6Z)
ghpsdr3 (by John Melton G0ORZ/N6LYT OpenHPSDR and Softrock)
QtRadio (by John Melton G0ORZ/N6LYT OpenHPSDR)
jmonitor (by John Melton G0ORZ/N6LYT OpenHPSDR)
CuteSDR (RFSpace netSDR)
PowerSDR (Flex)
PowerSDR.xxx (OpenHPSDR)
PowerSDR-IQ (IF-2000 board from RFSpace)
Rocky
KGKSDR (M0KGK)
Spectraview (RFSpace)
Linrad (Leif SM5BSZ)
iSDR (iPhone)
CUDA (supercomputer parallel code by Hermann DL3HVH)
Skimmer/SkimmerServer (Alex VE3NEA)

I hope others can add to this list. The only consolidated source of this info that I know of is from Christophe Bourguignat F4DAN <f4dan@...> at: http://f4dan.free.fr/sdr_eng.html

thanks for your question Dan,

thanks Ken.

yes i know there is a plethora of software out there now.

I am mainly wondering if there is any Windoze SDR software that
will use the ethernet connection, and offer a panadapter view
in MEGAhertz, instead of KILOhertz....

AND operate and transmitter...HI

73, w5xz, dan.

Ken, thanks for posting the overview !

Dan, i know that recent versions of PowerSDR should have some ethernet support in since the new ethernet adapter for HPSDR is now available. It should not be too difficult to integrate the support for the N2ADR frontend since the control is rather simple.

I fear i have no time to finish the API description this week.
Earliest beginning next week. I can just publish what i already wrote down if someone is interested.

regards
Mario

From: Mario
Topic: 77 Message: 97

Hi,

yesterday i did some few measurements on the receiver of my DL7LA/DL7IY PCB.
I measured the following data:

MDS, sine, 2.8kHz, 300Hz Clipping48k Read Clipping 1M
1.8 -113dBm -122dBm 4.4dBm 2.4dB -6dBm/-0.6
3.6
7.1 -109dBm -119dBm 4.4dBm 2.4dB -6dBm/-0.7
14.2
28.5 -111dBm -121dBm 2.3dBm 2.1dB; max inp reading 0.9dB, noise around -60dB -4dBm/-0.4
50.5 -110dBm -120dBm -1.9dBm -0.7dB; max -4dB, noise -60dB -2dBm/-8.7 very nois

I measured minimum detectable signal when the wanted signal becomes 3dB more than the noise that falls into the desired bandwith for 2.8kHz and 300Hz (2.8kHz just for comparison). In addition i tried to check the clipping input power (and the signal strength reading in QUISK) for two different decimation rates (48kHz and 960kHz).
What i do not unterstand currently is why the both values are different. I also do not know if we can trust these values.
I noticed that long before the receiver clips the noise level left and right of the sine carrier goes up as well. I assume that this is due to the noise of the test transmitter. I have to check if i can find a suitable test generator with such a clean output signal.
I am excited to compare to the results from others.

regards
Mario

It may be bit more difficult than that because there are reports that
Windows doesn't handle UDP transfers very well because of latency
issues. Maybe large buffer will help though. See e.g. QEX Jan/Feb 2011
page 14.

Cheers,

Kaj

thanks for the reply

does Linux handle UDP's better? I am not big micro$oft fan, but windows 7 does seem to work..

does HPSDR PowerSDR allow a panadapter to 'see' 1 or 2 Mhz? instead of 200 Khz ??

I am comfortable with PSDR on my flex 3000, and like it. the GUI is nice, IMHO.

And, not sure if I am smart enough to learn Python, without a LOT of coaching...to modify QUISK to my liking...

> does Linux handle UDP's better?

Yes, 8 Gbit/s has been demonstrated professionally over internet, see e.g.:
http://www.metsahovi.fi/en/vlbi/vsib-docs/eVLBIworkshop.pdf

And the QEX article gives latencies for both, Linux being much more responsive.

However, I have not made any tests with Windows personally, so
increasing buffers _may_ solve the problem for modest speeds (100
Mbit/s) with N2ADR-type cards. I just wanted to mention this to
decrease debugging time for someone :-). Perhaps first step would be
trying QUISK and N2ADR-type card in Windows, if it works, all is well.

73,
Kaj OH6EH

Topic: 77 Message: 103

Hi, all,

FYI I made some high level measurements using generators with low phase noise. Pleas see my file area. To emphasize any issuses related to possibly higher ADC sampling errors I deliberately chose 50 and 80 MHz. The AD9912 DDS uses an EPSON 700 MHz clock and the 80 MHz xtal oszillator is manufactured by AXTAL, owned by Bernt Neubig, DK1AG. It has also very low phase noise.

The board used is my experimental 2 layer setup. I also trust that Helmut's boards will be superior due to better grounding and supply filtering.

Is it an issue of windows not handling the udp well, crummy nic drivers, or something more sinister such as a task scheduler that has larger granularity on time slots?

> Dan, i know that recent versions of PowerSDR should have some ethernet support in since the new ethernet adapter for HPSDR is now available. It should not be too difficult to integrate the support for the N2ADR frontend since the control is rather simple.

It may be bit more difficult than that because there are reports that
Windows doesn't handle UDP transfers very well because of latency
issues. Maybe large buffer will help though. See e.g. QEX Jan/Feb 2011
page 14.

Using a process with a hardware high resolution timer to drive a (sofware) event to send data udp from a tx buffer, buffering it on receive as needed, and sending a packet to application from rx buffer each time a packet is sent should be pretty straightforward. It should be possible to calulate the buffer size to be half full at a nominal millisecond delay. To correct for a miscalibrated pc clock, the high resolution timer setpoint could be adjusted. In an ideal world, I wonder if one could write a kernel device driver that could export a stream as if it were a firewire device but have an ethernet back end, allowing the application to ignore the actual type of interface providing the data. Even better would be to find a way to calibrate the timer such that the os task scheduler happened to have an integer number of time intervals between transfers, say every 16th timeslot, with a real time priority to virtually eliminate jitter with a fixed size buffer (the alternative is to transfer a variable number of sample pairs and rely on the application to process a certain number of samples convenient for fft/ifft each time slot with a small buffer of its own).

The design philosophy I have in mind is sort of like what you'd find in synchronous optical network hardware that processes packetized data (for FEC), but at the same time has a mux to provide drop/insert functions. The average line rate is locked in step between sources even though there is a small amount of jitter.

Thoughts?

> does Linux handle UDP's better?

Yes, 8 Gbit/s has been demonstrated professionally over internet, see e.g.:
http://www.metsahovi.fi/en/vlbi/vsib-docs/eVLBIworkshop.pdf

And the QEX article gives latencies for both, Linux being much more responsive.

However, I have not made any tests with Windows personally, so
increasing buffers _may_ solve the problem for modest speeds (100
Mbit/s) with N2ADR-type cards. I just wanted to mention this to
decrease debugging time for someone :-). Perhaps first step would be
trying QUISK and N2ADR-type card in Windows, if it works, all is well.

2011/5/12 Marciniak, Ed <elmarciniak@...>

> Is it an issue of windows not handling the udp well, crummy nic drivers, or something more sinister such as a task scheduler that has larger granularity on time slots?

We discussed about this a while ago in the SDR-Widget group and Sivan Toledo wrote a very good summary:

"The problem is not the network, usually. The problem is that the SDR application is not scheduled often enough. Usually it is, but sometimes the PC may decide to run something else for say 200ms, or even 500ms. There is not enough RAM in the MCU to bridge over these gaps, so you will lose the transmit signal. At data rates of say 92ks/s, this happens every few seconds; it's not rare. I don't know of a way to resolve this with UDP. But I did manage to overcome the problem with TCP. Basically, the application puts enough audio in the socket to bridge over these gaps (say a second of audio). Then the MCU essentially pulls the data by acking packets, and this causes the OS on the PC to send more and more audio out of the buffer. This goes on even while the OS is running other processes. UDP works well for receive, though."

So, if I understand correctly, the problem is in transmit when Windows is producing the stream and the scheduler sometimes forgets the existence of the UDP transmit process for awhile. Using larger buffers help but increases latency. If you have a way to schedule processes regularly in Windows, there should be no problem.

Using TCP would be a possibility but doing it in FPGA is much more difficult than UDP.

Sivan's article about this in QEX is also a very good reading.

Cheers,

Hi Francesco,

currently there is a lowpass filter before the ADC that should filter out frequencies above 62MHz. You would need to not populate or to remove it and use a bandpass filter.
I assume that nobody is working on such a extension currently but probably that is an interesting idea to try the extension of the receiver part. DL7LA/DL7IY already tried reception of 144MHz band.
One problem of quisk is that there is currently no demodulator for WBFM signals. I know of no SDR software that has this implemented currently.

regards
Mario

Hi, Francesco and group,

I hooked up my HP8645B generator directly to the ADT4-6T transformer input at my setup. Input level was -60 dBm. FYI here are some results in the notation ' generator frequency in MHz / display reading in dB scale on the display in GrapH mode'. Sampling rate was 240 kSps:

10/-60; 30/-58; 40/-61; 50/-59; 60/-60; 70/-61; 80/-63; 90/-65; 100/-65; 110/-67; 120/-70; 122,88+\-100 kc/abt-80; 130/-68; 140/-70; 150/-70; 160/-72; 180/-75; 200/-75; 220/-78, 245/-80

Thus with a suitable amplifier in front even the 220-Mc operators should be pleased;-)

Add-on hardware are available now.
FMC-108-28 converts FM broadcast band to shortwave .
(http://www.nti-online.de/eFMC%20108-28.htm)
I got it and it works great for me.
My setup:
FMC + QSD receiver + 192kHz/24 bit soundcard .
One single board should be much better !

> One problem of Quisk is that there is currently no demodulator for >WBFM signals.
True, but soon or later it will be there.
Some source code GPL is available:
http://sourceforge.net/projects/fmstack/
It works on PERSEUS receiver .
Unfortunately it is modern C++ code, very well written.
Andrea Montefusco (private communication)
ported it to Perseus-Linux software.
Integration on Quisk can be done only by a quite competent
programmer !

>I know of no SDR software that has this implemented currently.
>
WRplus (derivative of Winrad by Sandro Sfregola,
http://www.wrplus.altervista.org) dit it quite well I must say.
Unfortunately Windows binary and commercial product quite soon
GNUradio shoud have some code , I don't remember written by who

112. HiQSDR V2.4 Boards / Kits

Yahoo group: n2adr-sdr
Date: 2011-05-16 13:21:35 UTC
From: Helmut Goebkes
Topic: 112 Message: 112

Hi Group members,

The new Version 2.4t Boards arrived on Friday.
All bord orders are deliveres next two days.
All parts for the complete modules are sent to the factory
but the CVHD-950 122.88 MHz oscillatore is not available
before June 15. I spent nearly one day phone around the world to
get them faster but i had no luck to get them before 15th June.
Now we complete the boards without the oscillator as first.
I add the oscillator by hand if they arrived to hold the delivery
time for complete boards as short as possible, but the delivery
will be delayed approx. 2 weeks.
The reason for the delivery delay of the 122.88 MHz osc is the
Japanese catastrophes, the distruibtors told me.
I do not know if this is the truth, but we have to deal with it...

On the Weekend i made a sample assembly of the new board by hand
to check for any problems. After assembling, soldering (Reflow) and
cleaning the board, programming the FPGA and setup was done just
in a few minutes. All works from the first moment on as expected and the measurement
results are equal to the one made at the prototype, so noone should have any problems with
it.

Shure, if yo have questions or problems, you can contact me
(best via email)

I corrected the partslist for two minor changes
(RN1,R39=1K instead of 10K).
A friend of mine (DG7MGY) helped me to bring the complete files
and assembly instructions to a CD, usable with any Browser.
Also we added all relevant data sheets as well as assembnly
pictures and partslist as PDF and/or Excel files.
In the files area, you will find actual pictures from the
sample assembly and the board.

Thanks for the update Helmut.
Sourcing parts can be a major headache, even for ones you think should
easily be found.
I also requested my board be programmed for IP address 192.168.10.20 as
I learned from Jim that to do so requires reprogramming the FPGA.

Hello Hans,
take a look to the CD open index.htm with your favorite Webbrowser
you will find Information under Software->The FPGA.

You need the FPGA Software from N2ADR (on CD),
Altera Quartus Web Edition IDE. Follow the Weblink from the CD, about 2Gb to Download from Altera Website and a JTAG Programmer who will works with the Altera Quartus IDE and the FPGA.

A good and cheap Adapter are the EEBlaster from Entner Electronics,
also as Weblink on the CD.

Also you will find more Information at the Altera Cyclone III Handbook
(on CD)

119. Errata HiQSDR Bill of Material

Yahoo group: n2adr-sdr
Date: 2011-05-22 17:52:31 UTC
From: Helmut Goebkes
Topic: 119 Message: 119

Hello Group,

Hans Barandl told me that i forgot T1,T2,and T3 in the Bill-of-material (BOM) List. This three transistors are FDN302P and easily availabe from several distibutors.

A insconsitency exist between BOM and Circuit diagram:
Please be shure that R8=3K9, R9=1M (can also be ommitted) and L10=15uH
(Mikrohenry!) In my Bom all is correct, but maybe older Versions of Circuit shows different values.

The drawing of the heat spreader was printed mirrored. The slot milled
must not be in the lower right side, it must be at the lower left side!
If anybody needs heat spreader, Technologie 2000 have them on stock
(including silicone foil to isolated the heatspreader)

Hubert,
sorry, I was not shure and I did not read the handbook in detail.
Does this mean that the EPCS16 can be loaded via the JTAG protocol ?
Then I assume it would be sufficient building a wiring adapter between the HiQSDR connector and the JTAG ?

Hello Hans,
take a look to the CD open index.htm with your favorite Webbrowser
you will find Information under Software->The FPGA.

You need the FPGA Software from N2ADR (on CD),
Altera Quartus Web Edition IDE. Follow the Weblink from the CD, about 2Gb to Download from Altera Website and a JTAG Programmer who will works with the Altera Quartus IDE and the FPGA.

A good and cheap Adapter are the EEBlaster from Entner Electronics,
also as Weblink on the CD.

Also you will find more Information at the Altera Cyclone III Handbook
(on CD)

Hello Hans,
yes all what you need is the fpga sources, the Quartus IDE
and a suitable JTAG Adapter.
Helmut use the EEBlaster Adapter which is connected to the Board.

Hello Hans,
i forgot the connector to the JTAG are X4 MICROMATCH_10

Pin1 DCLK
Pin2 GND
Pin3 CONF DONE
Pin4 +3,3V
Pin5 NCONFIG
Pin6 NCE
Pin7 DATA
Pin8 NCS
Pin9 ASDI
Pin10 GND

At the moment i have no equipment to give you more Infos about
the steps in Altera Quartus Software.

Hubert,
thanks a lot , this was the missing link.
I will try my own blaster (which has this typical 2*5 pin JTAG connector) and report back whenever I have news (probably not so early , I will travel the full next week).

Hello Hans,
more Information about programing yo will find at chapter 9. Configuration, Design Security, and Remote System Upgrades in the Cyclone III Device Family Handbook. (Site 161)
The Altera programed in AS-Mode Fast Active serial (AS) see Pinout X4

Comparison between AS and JTAG with 10pos. Connector Pinout
AS JTAG Pin

DCLK TCK 1
GND GND 2
CONF_DONE TDO 3
Vtarget Vtarget 4 (+3,3V)
nCONFIG TMS 5
unused nCE 6
DATAOUT unused 7
unused nCS 8
ASDI TDI 9
GND GND 10

If you have a JTAG Adapter maybe it will works with the Altera Quartus Software.
My own JTAG Adapter dont work with Altera Quartus Software in AS-Mode.

125. Programming the FPGA

Yahoo group: n2adr-sdr
Date: 2011-05-23 08:45:45 UTC
From: Helmut Goebkes
Topic: 125 Message: 125

Hi Hans, Hubi, Hi List

programming the FPGA is quite easy.
You should have an installed Quartus 10 on your pc and the drivers
installedfor your programmer (eeblaster or similar) as a starting point.
The you have to define the transceiver project in quartus and synthesize the project by
starting the full compilation (Read Handbook or help how to do this).
After having a coffe-break (systhesis needs about 10 minutes...)
the result will end in about 15 warnings - you can ignore them but there should be "NO
ERRORs".
Then go into the tools menu, click "programmer" and select
"active serial programming" from the pull-down menu.
load file "Transceiver.POF" as programming file,
Check in the file window "program/configure, "verify" and "blank check" then star
programming the "Transceiver.POF" as programming file and start...

After some seconds blank check, programming and verification
is done. now separate the HiQSDR from the programmer and toggle power.

The current consumed after programmed the FPGA rises from approx 350mA
before programming to about 950mA after programming because the programm is working
internal now with the clock speed....

Next connect a network cable and try PINGing the HiQSDR....

73!
Helmut, DB1CC

Hi All,

Are the latest PCB files available? If so, where?

Thanks,

Rob

You may ask Helmut for the Gerber files directly. They are not in the forum currently.

Hi All,

What ideas/wishes do you have for the next generation of the hardware?
I'm considering doing an open board layout in Kicad. One thing I have
some interest in is adapting the N2ADR design for use as a vector
network analyzer.

73,

Rob

I have converted the Eagle format N2ADR schematic & libarary to Kicad
if you are interested. It is quite easy, perhaps you have done it
already.

> some interest in is adapting the N2ADR design for use as a vector
> network analyzer.

Good idea! Maybe it would be useful to make a modular design and put
FPGA and ethernet chip to a separate smaller board?

Cheers,

Tying 2 or more units to a common clock would be a nice option. The pcb pads for buffer and clock in/out connectors could be left empty and populated as an option.

Gigabit ethernet support would be nice.

Providing a port for a cypress fx2 cpu would allow for doing certain things that are hard to do in fpga. An example that comes to mind is receiving a control packet to change the udp port or ip address, or perhaps uploading filter coefficients. Supporting an lcd display and/or encoder for tuning would be another (tuning on an encoder is simple enough, but extra logic area would be used to provide a variable tuning rate dependant on how the knob is being used).

Transferring an audio stream using H.323 or SIP would be nice since it would allow transfers through firewalls, QOS and buffering, but would require a processor to handle.

Check with Phil Harman VK6APH in the OpenHPSDR group:
VK6APH Phil Harman <phil@...> who has been
thinking about how to adapt the HPSDR Mercury DDC receiver
for VNA work. He may have some great ideas for you.

Hi,

nice idea to do a layout with KiCad. It should be possible at least.
I did not use it for large things until now.

For the moment i have no additional wishes to the frontend hardware. First i want to see, what we can do with the current one.

I assume there will be some possibilities for improvements in the FPGA design (spur free range of the digital oscillator) and also increasing the usable bandwith. Further things may be switching the board to TX from the GUI for SSB and probably full duplex.

For VNA operation you would need a second RX channel for the reference channel or do you know another way ?
With an Dual Channel ADC this would be more easy to do.

Regarding a Gigabit Ethernet interface i understood from Jim that the FPGA would limit the speed. So if someone would like to use a Gigabit Ethernet it might be necessary to switch to another FPGA.

What i think is also interesting would be to have demodulation and control independent from a PC. Probably that could be done by a second FPGA board or by a DSP board.
PA and selection are other points on the way to a complete transceiver.

Regarding the PC software there is much to do to get a fully usable transceiver. Sub-RX and some other goodies ;)
What i think could be very interesting is a kind of colaborative receiver that can be used for locating the origin of signals that appear on shortwave by measuring the signal propagation time.
Another thing would be the usage as a software defined transponder.

regards
Mario

Hi Mario, et. al.,

The second A/D for the VNA detector is too expensive for me. I was thinking of something like this <http://www.dxatlas.com/Rocky/Files/Rocky_VNA_v1c.pdf> idea from N2PK. Thanks for all the ideas and discussion.

Hi Rob,

thanks for the link.
I assume that the modification he describes brings a part of the original signal to the QSD and the received signal to the second channel only, right ? So the concept is rather similar to what
it is done in the VNWA2+ from DG8SAQ.
Currently i do not know if it is possible to switch on RX and TX of the N2ADR frontend at the same time. This would probably be the first challenge. But we are rather at the beginning of this interesting project. Lets see how much we can achieve. My opinion is that the people that contribute also set the direction ;)

Hi All,

These oscillators used to be about $100 each if my memory serves right.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=160596753547

This seller only wants $5.50 shipped.

73,

Rob

Hi Rob,

the oscillator you suggest is unusable in this application.
First, the frequency must be 122.88MHz, not 125MHz, because 122,88MHz
is even devidable into 48KHz. The Software is not able to handle non-integer dividable main osc frequencies.
Second, the "low phase noise" claimed is not really good,
the sugessted osc has 1pS compared to 0.13pS of the Crystec CVHD-950

138. 128.88MHz Oscillator

Yahoo group: n2adr-sdr
Date: 2011-06-11 15:17:10 UTC
From: Christopher Bartram
Topic: 138 Message: 138

Hello everyone!

It strikes me that the performance of the transceiver is such that it would be worth anybody designing a new board adding provision for an external 128.88MHz input. That way it would be easy to use a very low noise discrete component oscillator - packaged oscillators tend to have relatively poor close-in spectrum - locked to to an external frequency standard.

I'm looking at doing that on the board I eventually hope to make for myself, and I've been waiting for Rob to produce his Kicad version of the PCB so that I can modify it!

I know something about the design of low-noise oscillators, and I've been thinking about ways of locking a 128.88MHz oscillator to 10MHz adequately cleanly. The problem is a little more subtle than using a low-cost synthesiser chip ...

I have used them on the Charleston Receiver, to replace the preprogrammed can oscillator, and noticed a significant reduction in phase noise. I'm using one in my future designs as well. The ability to fine-tune the master oscillator to correct for frequency errors comes in handy (no need to tweak software/FPGA oscillators).

I also note that Phil Covington used them in the Quicksilver receiver, after having phase noise issues with other devices. He was specifically looking at phase noise as one of his important parameters when selecting that device. His design used a 125MHz version, and therefore he provides a D/A for audio out, to get around the 48kHz exact sample rate problem, if I remember correctly.

It would be nice to have them checked out thoroughly, but I think they might be OK for the master oscillator.

Hi Helmut,

I realize that the present software won't suffice; I was thinking of
using a call to libsamplerate <http://www.mega-nerd.com/SRC/index.html>
or one of his siblings. The CVHD-950 aren't available as samples and
they are around $50 here, so the price of the Valpey is 10 db less. The
phase noise isn't quite as good, but it was good enough for the SDR-1000
and the N2PK VNA. It is a bit difficult to compare the two oscillators
as well; one gives max one sigma and the other gives typical jitter.
The pin outs of the oscillators are the same, so if my ideas don't pan
out, all I need to do is swap them out. :-)

Hi Chris,

I guess I better get busy. :-) Graduation is tomorrow, so things ought
to slow down soon. I am planning on having provisions for an external
oscillator.

73,

Rob
KL7NA

thanks Terry. I thought i saw that on the AMRAD site..

I still marvel at the Si 570...truly remarkable spec of a chip !
for this, we don't even need the 'hi end' device, right?

and the guys down in Austin are building an even better controller
for it now (AQRP yahoo group)...but it guess it doesnt matter,
once you set the freq, it 'remembers' ??

good luck with the 'charleston transceiver'...when it comes to
fruition...

Hi all,

i guess trying with other oscillators than the one from Crystek is good. Just keep in mind that you really have to look to the results rather carefully. The results with the Crystek oscillator are already really good. With an external oscillator it might be even better.
I thought about using an G8ACE OCXO as clock source. This one can be locked to a external reference as well. I already have two for microwave applications and they are really good.
Regarding the SI-570 i strongly recommend to be a bit carefull. The noise figure close to the carrier is really good but there are some significant integer spurs far from the carrier frequency. This makes it unusable fr microwave applications. For the most shortwave SDR they are probably good enougth and much better than the cheap DDS solutions.
Regarding integrating the audio output (and the input as well) i am not a big fan of this solution since you create more latency and more traffic on the ethernet interface. But probably it is still worth thinking about that.

regards
Mario

Hi all,

Again I underestimated the work involved and overestimated the available time.

But today I finally uploaded the converted Kicad schematic and library
to the files area. There are some warnings due to connections from
power out to bidirectional pins, kicad experts surely can sort them
out...

Cheers,
Kaj OH6EH

Kaj:
One additional thing that should be done. On each of the parts, uncheck the
"Show" box for the footprints. That will clean up the schematic a lot.

Yes, that's a good idea. Well, I did it using emacs text editor, a bit
faster than with the GUI :-).
See the files area v0.3.

Cheers,
Kaj OH6EH

Hi Kaj,

What kind of errors are more likely to be in your converted files? (It would help me to know how you did them, so I know what to concentrate on when checking them over. Did you do anything by hand, etc.?)

Thanks,

Rob

That's a good point!

I had to rotate all active components (including the FPGA!) and many of the passives, I made aliases for capacitors and resistors, resized the sheet, changed the ground pin definitions for many actives (bidi -> power input or output for the regulator). The last one should be improved but I don't know how to deal with I/O pins (that really are bidi) that are connected directly to VCC or GND (perhaps pullup or -down resistor should be used in the design to humor the erc). For v0.3 I edited the sch so that the footprint designators are invisible.

Cheers,
Kaj OH6EH

Thanks Kaj,

It sounds like the netlist is likely to be correct. That should save me
some tedious painstaking work I was considering.

Again, thanks!

Rob

Is someone activity working on a KICAD design or is this project still using EAGLE?

Hi!

2011/6/22 burrellshane@... <burrellshane@...>

> Is someone activity working on a KICAD design or is this project still using EAGLE?

Well, I think both are used now. The forks that have produced hardware
are using Eagle to my knowledge (although I haven't seen the sources
which is a bit worrying). I converted the schematic to KICAD and at
least Rob and myself are continuing from there.

I have a number of versions in mind... First, to get used to Verilog
and quirks of high density, high speed PCB design I am 'porting' the
ethernet interface to connect to a cheap EP2C8 devboard (eBay). Might
even be useful for simple projects.

Cheers,
Kaj OH6EH

Hi,

I'm playing with the Kicad project. My objective is to build one, and
at least make my Kicad files available. I'm trying to minimize my cost
and make it work as a vector network analyzer. With samples, the cost
is about $100 at this point. The junk box should help further.
Hopefully I can use this to learn some Verilog as well. If you have
suggestions for revisions, I'm soliciting them still.

Thanks & 73,

Rob

Is there a repo or something setup to get the files. I'd really like to work on the project with others rather than a solo project. Something similar to micropendous seems to work well for group development of boards.

From: Mario
Topic: 129 Message: 157

Hi,

currently there is no repository for layout or sourcecode files.
I could imagine that we create an open repo at github and the kicad stuff is stored there.
If N2ADR agrees also versions of the FPGA design.
Regarding the sourcefiles:
You can download the original Eagle layout at Jims page.
Kaj uploaded his converted Kicad schematic to the files section here.
Helmuts Target based layout data is not available on an open basis because it was made with an professional version and it cannot be edited by others. He told that he can provide the Gerber data on request. Thats probably not what you need for editing on your own.
Probably github is a nice tool to host some information about the various versions as well.
Who wants to create a repo ?

regards
Mario

That would work really well if everyone that has contributed is in agreement and can post there work into the repo.

I'm fine with any contributions I make. I'm in the middle of things at
the moment.

73,

Rob

Launchpad would most likely be the best bet. KIcad has moved there. If we can get a small group together and get permission from authors of any source used I'd be happy to get the project going.

161. ATTENTION! Wrong Parts deliverd by Digikey!

Yahoo group: n2adr-sdr
Date: 2011-06-24 13:08:47 UTC
From: Helmut Goebkes
Topic: 161 Message: 161

Hi Group, N2ADR-SDR / HiQSDR builders!

Digikey delivered wrong parts instead of ordered LTC6405IMS8E#PBF

The worng delivered Part is LT3080 with the same case (MSPO8).
a wrong LT3080. You can only differentiate it by the code
marked on top of the MSOP8-Part it must be marked "LTDKN"
nothing else!

The wrong Part is marked "LTCBM" and is a LT3080 Voltage regulator!

If you power the HiQSDR or N2ADR-SDR with the wrong delivered part,
the circuit draws several Amps from the 5 Volt source and the
following ADC ADS55005 (Expensive!) dies in seconds!

If you ordered LTC6405 from Digikey, please check the correct marking
and contact Digikey.
We got two times the wrong parts, even we complaint the parts...

We check all deliveries, so HiQSDR-Kits contains only correct Parts!

73!
Helmut, DB1CC

Helmut
Is it still possible to order a kit?
Tim

Hi Helmut,

thanks for the hint. I checked and also got the wrong part.
Did you get replacements from Digikey after complaint ?

regards
Mario

Hi Mario,

yes, DIGIKEY replaced the parts without any comment,
currently they are in cologne at customs,
i hope now they are correct ;-(
But nothing about my complaint of the defective ADS5500
- so i have to discuss with digikey a little bit harder...

ps: I also have to pay again the german import tax
("Einfuhrumsatzsteuer") wich is not correct
because thats digikey's game for these replacement parts...

pay attention to this!

73!

Some companies seem to discard customer relations or they can't use email.

I checked Farnell UK and they have 32 in stock, may be dealing with another Farnell company in Europe would yield better results, avoiding customs and VAT mishaps..

I once dealt with such a UK company that once never told me that the returned motherboard was no longer available and when I eventually got a response the email just said they had issued a refund. I shall never put business their way again.

168. Quisk 3.5.4 (spectrum zoom implemented)

Yahoo group: n2adr-sdr
Date: 2011-06-28 05:57:54 UTC
From: Mario
Topic: 168 Message: 168

from N2ADRs webpage:

Quisk Version 3.5.4 June 2011
==========
I added another slider labeled "Zo" to zoom (expand) the graph screen scale
so that narrow signals can be examined. The center of the graph is changed
to the tuning frequency when zoom is turned on. To cancel zoom, move the
slider back to the bottom position. You can tune as usual even if zoom is on.

I put the band buttons on one line so I could add more control buttons.

Topic: 171 Message: 171

ok, i installed ubuntu linux 11.04 on my laptop.

fairly easy, smooth. now have a machine that will boot either
to Linux, or Win7....the ubuntu install cd made a new partition
and everything seems to work...

I can not, however, figure out how to "re-compile QUISK"...

73, w5xz, dan

Hi Sid,

link was broken. Do you mean this one ?:
http://mobokits.stormwarning.org/filebrowser/download/913

Dan: Do you have a 64bit Linux ? For 32bit you do not have to recompile. On 64bit just type "make" in the Quisk directory.
There are some packages that need to be installed. For example GCC.

From N2ADRs documentation on Quisk:

Quisk needs a few additional packages to run. All should be available as packages or RPM's so you don't have to compile the source. Generally you would get the most recent versions rather than the versions I show below. Needed packages are:

* python2.6, the Python programming language. See http://www.python.org. This almost certainly is already installed on your Linux. Use the version you have, or get the most recent version.

* python-wxgtk2.8, the wxPython package used for the GUI. Get the most recent version available for your Python version.

* fftw3, the Fastest Fourier Transform in the West. See fftw.org. This is a great FFT package and is also used by GNU radio.

* python2.6-dev, fftw3-dev, libasound2-dev, portaudio19-dev These are development packages that you need so you can change and recompile the Quisk C-language files. Get the version that corresponds to the software you have. If you get compiler errors, check for missing "-dev" packages.

The last point is important for recompiling.

regards
Mario

That link also works as does
http://mobokits.stormwarning.org/content/mobo-43-files/
<http://mobokits.stormwarning.org/content/mobo-43-files/InstallingLinuxSDRs-006.odt>
where the file will also be found. I now see that even using wget it
doesn't like the addition of the filename.

OFF TOPIC

Jim, there is still the softrock permissions error I reported quite a
while back using openSUSE or Ubunt 11.04 while VK6JBL's files still work
with 3.5.4.
73 ... Sid.

It all depends on the packager and since there are different package managers in different distributions, a packager could spend all his days providing point and click. Most of the packages in Linux can be installed with GUI and mouse clicks, but the extra effort isn't worth it to software like quisk where Jim would have to spend perhaps more time on packaging than on actually developing quisk.

I build RPM packages almost every day and .deb packages occasionally, that's not really a problem, the added chore would be the extra steps needed to include the configuration setup.

It's very easy to edit a text configuration file.

As for packages there is x86, x86_64, ARM, PPC and a multitude of other architectures (I count 24) that support Linux so building from source makes sense. I have quisk and sdr-shell on x86_64 on openSUSE and Kubuntu and on Ubuntu ARM. I also have quisk and sdr-shell on ARM using the Angstrom distribution.

Hi, adding some dependency information and creating an archive is a good idea. Probably someone can provide the necessary files to Jim or build the packages from the sources. For me it appeared rather easy to unpack and use Quisk but probably for the first installation it would be easier to have automatic resolution of dependencies.

regards
Mario

181. QUISK with SDR-1000

Yahoo group: n2adr-sdr
Date: 2011-07-04 14:08:04 UTC
From: g4vqp
Topic: 181 Message: 181

Hello all

I have just started playing with quisk with the SDR-1000, before getting too deeply into new hardware.

Quisk is working well, I am controlling the SDR100 with GRIG via the parallel port at /dev/parport0 (/dev/parport0).

I would like to control the hardware from quisk.

I found and compiled sdr1k c and swig from the sources, without errors.
The test program works as long as the lp module is not loaded!

Is this the right approach?

Any help will be greatly appreciated.

73 de G4VQP

182. QUISK with SDR-1000

Yahoo group: n2adr-sdr
Date: 2011-07-05 14:06:58 UTC
From: g4vqp
Topic: 181 Message: 182

Lo All

Further to my last, I have eliminated some possibilities.

The C++ hw_test works correctly.

The SWIG generated tktest.py fails with the error no module named __sdr1khw

This is the same error message as attempting to import the python into quisk.

Should this file have been created, or some issue with imported paths from the environment?

Any thoughts please

73 de Chris
G4VQP

Hi Chris,

i want to give you a short reply because probably nobody here can help you.
I also do not have an SDR1k but i tried to find out about what software you are talking.
It seems to be a piece of Python code that uses some C code to control the SDR1k. You try to combine it with Quisk to get the SDR1K supported by Quisk, right ?
Probably Bob G3UKB can help you (bob@g3ukb.co.uk). His call is stated in several files of the Pylink stuff.

regards
Mario, DH5YM

I thought N2ADR transceiver described in the QEX was prior art (HiQSDR
just fine-tuning the layout) and even that was not the first... Maybe
your definition of 'real' is different from mine..

Lej Kaj,
yes you are right. There are many DDC/DUC Transceiver designs.

As far back as 2002 you can find the "Digimit" DUC by Nico Palermo IV3NWV (President of Microtelecom) and of course his current DDC Perseus product. http://www.microtelecom.it/digimit/

The OpenHPSDR group was formed by Phil Covington N8VB in 2007 and the result was the great DDC Mercury receiver and an orchestra of companion boards including the Penelope/PennyLane DUC transmitters.

Hans HB9CBU invented the ADT-200A which is still one of the most beautiful DDC/DUC units. I believe his daughter Doris HB9DSV assisted in the design of the microprocessor control software and front panel first shown at the Vortrag Hamfest in 2007.

But here we are in 2011 and the OpenHPSDR experimental platform with the Atlas backplane is the only DDC/DUC transceiver for general sale. OpenHPSDR is working on the release of the very interesting "Hermes" single board transceiver http://openhpsdr.org/hermes.php but it is under extensive development.

Alberto I2PHD and Giuliano I0CG introduced the SDT-2011 DUC Tx in 2010 and it was shown at the April 2011 Modena Hamfest. It is a beautiful DUC transmitter that can be coupled with an SDR receiver (DDC or QSD). http://www.i0cg.com/sdr-x.htm

Phil Covington N8VB introduced the exciting "QuickSilver" project http://www.philcovington.com/QuickSilver/ that includes the QS1R DDC receiver and plans for a bandpass filter set RFFE1 and the QS1T DUC Tx. The QS1T is in the early stages of development along with the companion software which features MAC/LIN/WIN platform support.

Perhaps you can help me recall some other projects that are under development or may reach a larger Ham and SWL market? many Hams here in the States are excited about the new Elecraft KX3 and we wonder what might be in the future for a "K4" product?

I am not listing the many varied QSD designs that are readily available, such as the "Ensemble" from Tony KB9YIG. I have collected a list of QSD designs here:
http://www.n9vv.com/collected-list-QSD-kits.html and the new N2APB "Cube" certainly leads the way with a handsome QSD Rx/Tx design.
Of course the first QEX articles in 1999 by Gerald Youngblood K5SDR introduced the SDR-1000 QSD transceiver as a 3 or 4 board stack that eventually became the extensive Flex Radio product line including the current 5000, 3000, and 1500 models.

I am watching the N2ADR design/HiQSDR with great interest and I hope to see a fully functional DDC/DUC Transceiver for general sale as a kit or product in the future.

We are all sending our very best wishes to Helmut DB1CC and others for the greatest success with the HiQSDR design.

cheers,

I gathered that the HPSDR Hermes was demoed at Dayton. It was supposed to have been released last April but has been delayed by the decision to change from USB to Ethernet.

There is the QS1R RX and I think they've just added a TX board to it and testing back at the factory.

I don't know whether the term first fits as it appears to be quite close to Hermes, but it's certainly a leading and welcomed advancement from the HPSDR multiple board solution.
Where it's a first is that the software (quisk) is cross platform whereas all the HPSDR RXTX software is Windows only.
73 ... Sid.

Hi,

I'm finally getting a few minutes to work on this again. And as I work on adding up all the powers used by everything, I finally got to the FPGA. Quartus has some power analysis built in, but setting up the inputs realistically for a good simulation isn't quick and easy (at least for this novice). Has anyone made experimental measurements other than Helmut's before he programmed the FPGA?

Couldn't one make certain assumptions in trying to estimate?
(Yes I realize that's not the question asked)

One bit (sign) will flip in a roughly predictable fashion in a function related to frequency of strongest signal provided it it least 6 db greater power with a signal. If no signal, it might toggle 50% of the time along with several LSBs.

The bits in between will have some relationship to the received power.

Multiplier inputs that are zero will produce some partial products that are zero.

I put the I/O rate at 99% and I get 1.7 watts total for the FPGA, with I/O accounting for about 1/4 watt. I'm still interested in any experimental data though.

From: Mario
Topic: 191 Message: 194

I have just some old data, hopefully correctly written down to the piece of paper i found.
It was taken with the DL7LA/DL7IY PCB without programming of the config flash.
- 12V input
= switched regulator P3596 L-5.0 5.0V
o linear regulator LT1085 3.3V
o LT1085 2.5V
o linear regulator (i do not remember the type) 1.2V
= lin reg 5V for preamp
= lin reg 3.3V for AD/DA
= lin reg 7.5V for TX MMIC

sequentially putting all the stuff to power (at 12V input):
- only regulator and LEDs of power supply: 76mA
- adding 3.3V and 1.2V of FPGA: 246mA
- adding 2.5V of FPGA: 285mA
- adding 3.3V analog voltage: 347mA
- adding 5V analog voltage: 378mA
- supply also the TCXO to power (disconnected before): 550mA

With configured FPGA i see around 800-900mA at 12V with this configuration depending on the data transferred via Ethernet.

Hope this data helps.

regards
Mario

Thanks Mario!

Yes that is very helpful. According to my 99% I/O simulation in Quartus, the LT3080 (1.2 V regulator) wouldn't be able to handle the needed current. Your experimental work is very helpful. Thanks for digging it up for me!

73,

Rob

I was a little puzzled by seeing +6V input on the circuit diagram but
wondered why not a +13.8V supply.
Any worries about the extra voltage drop across the +5V regulator?
73 ... Sid.

Hi Sid,

Check the data sheet for the linear regulator you are using. The power dissipated in the regulator is

(13.8 - 5)*current

As you can see, you are wasting more power than you are using by a fair margin. I noted that Mario has a very large heat sink and runs 12 volts and Jim used 6 volts and just the case as heat sink. I'm inclined to do more like Jim, or use a switching regulator. I'm working now on a board that is set up to try several things out like that.

73,

Rob

I've been looking at the REG104-5 specs and I shall go with my original
idea of 13.8V --> LM317T on a large heatsink --> 6V.
Thanks,
73 ... Sid.

199. Re: Power Requirements?

Yahoo group: n2adr-sdr
Date: 2011-07-14 05:39:34 UTC
From: Mario
Topic: 191 Message: 199

Hi,

the intention of the big headsink at my setup is that i want to put a 5W amplifier on there later on. But the regulators are connected there as well. I use a 13.8V -> 5V switched regulator with linear regulators after that for the digital part.
The analog parts are connected to linear regulators directly supplied by the 13.8V. Reason for all that effort is to keep noise and voltage ripple away from the frontend. They are significant contributors to the TX noise because of modulation effects.
Anyway even with the big headsink the TRX is getting a bit warm (not hot).
To be honest i have not so much experience getting the noise off the output voltage of switched supplies. So for me this is also part of the experiment. I used 13.8V input because i wanted to limit the wiring and number of power supplies because i want to use the frontend portable.

regards
Mario

202. HiQSDR Power supplies

Yahoo group: n2adr-sdr
Date: 2011-07-14 11:43:30 UTC
From: Helmut Goebkes
Topic: 202 Message: 202

Hi Group,

i followed the discussion about power supplies for the N2ADR/HiQSDR boards last days. In principle, the best solution is a analog series regulator in means of low noise supply. On the other hand, this tend to dissapate a lot of heat and needs big Heatsinks.

In my opinion, the best is to combine both worlds. Personally i use for my fixed station a good switching wall power supply (attention: cheap ones produces a broad noise spectrum) with an output voltage of about 6 volts, 2Amps, electronically regulated (!)
Most distrubutors worldwide sell them for some bucks, but often you can cannibalize them from electronic toys or handys.

For portable or mobile use, i would also use a switching high efficiency preregulator. As an example, i setup a circuit diagram of a good and affordable switching supply solution into the files area (DB1CC/HiQSDR-Folder) made arounda LM22675. The whole Curcuit has only the size of a Thumb and converts 10..28 Volts into 6.5 Volts with around 1.2 Amps max. Efficiency is >85%. This is only an example, many other switching preregulators may work and saves energy (and heatsinks..)

A third option is a switching power supply with an active decoupler and using its output for the feedback to the switching regulator.

Its almost mandatory to model it in something like ltspice (free) if you can live with using a linear tech part. I can.

Getting ripple below 50uV doesn't take too much capacitance and costs maybe 1 USD in parts over basic switching power supply.

Ltspice will even give you a fourier spectrum of the output so you can see where the energy is concentrated at a glance.

From: Mario
Topic: 204 Message: 205

Hi Sid,

seems there are some strange problems with modules of Quisk.
Were is your quisk_conf.py file located ? I usually have it in my home directory and named it .quisk_conf.py
Second: Did you install the required packages ?
You need python-wxgtk2.8 and fftw3.
You should also install the module python-serial.
I do not know why quisk searches for a jack audio server. Thats nothing i see in your configuration file.
Thats why i asked for the location of your config file. I assume quisk uses another one.
The SDR should respond to ping requests. I assume the hardware is ok.

regards
Mario

Hi Sid,

i am not a Linux specialist, but the HiQSDR
is originally programmed in the FPGA
to an IP adress of 192.168.2.196 (as labeled on Top of HiQSDR)
Do you reprogrammed the FPGA to the new IP?

I see that no output sound name is defined.
The CD contains a config_py for Windows and Linux that
works fine for me and this can be the basic for your tests.
Shure, you have to adapt you soundcard
names for your computer.

Another Hint: Several People had problems if they
connect the HiQSDR directly via a cross-cable to a PC!
100MBit connections via Cross-Cables without switches in between
are mostly not stable!
Try connection via a switch (and a straight cable) please!

maybe that helps a little bit ;-)

73!
Helmut, DB1CC

names for your computer.

Another Hint: Several People had problems if they
connect the HiQSDR directly via a cross-cable to a PC!
100MBit connections via Cross-Cables without switches in between
are mostly not stable!
Try connection via a switch (and a straight cable) please!

maybe that helps a little bit ;-)

73!
Helmut, DB1CC

Perhaps pyserial but all the others are there and quisk worked with
Softrocks previously.
73 ... Sid.

Perhaps you forgot that I asked for it to be programmed in the
192.168.10 range as I don't have a programmer on hand. The
192.168.10.132 IP address that nmap returned is not one on my network so
I thought that was it.
I shall either have to readdress my network or set up a separate usb
network for it.

In the case of the HiQSDR I thought that only one sound card was needed.
Does quisk route the packets to one card, e.g hw:1 with Mic/Speakers on
another, in this case hw:0 as with I-Q processing?

```
if "win" in sys.platform:
name_of_sound_capt = "Primary"
name_of_sound_play = "Primary"
else:
name_of_sound_capt = "hw:0"
name_of_sound_play = name_of_sound_capt
```

Thanks I'll dig out a 10/100 switch and connect it to a USB ethernet dongle.

Topic: 206 Message: 211

If i am right then the IP of the frontend is 192.168.2.196. So you need to use another IP, right ?

Then you should be able to ping the frontend.

If there is no communication with the frontend then you will not see any signals within quisk.
Just observe the LEDs of your network interface. You should see much traffic if the interface is initialized in the correct way.

If that works and you still get no audio: Is there still this error message about missing Jack server ?

regards
Mario

212. Quisk / Network

Yahoo group: n2adr-sdr
Date: 2011-07-15 05:53:35 UTC
From: Helmut Goebkes
Topic: 212 Message: 212

Hi Sid,

sorry if i forgot to program to a specific IP!
As standard, 192.168.2.196 is programmed into HiQSDR
becaus this is the default address Jim used for Quisk/N2ADR-SDR
For most users this is practicable.

I got also strange results as long i tried a direct connection via crossed cables and used a older Netbook. My new netbook canoperated straight/crossed cables without problems. Best is Ping'ing the IP
to see if there is any response @ that address.
But i am shure, you are the better network expert then i..

the I/Q Signals are only transferres via the network and processed by
QUISK to get the demodulated audo signal. The soundcard (as far as i know) does not process the I/Q but is used only to play audio and pikup microphone signals.if you use one or two different doesn´t matter i think.

73!
Helmut, DB1CC

ps: a USB to Ethernet converter may fail because USB didnt transfer the UDP different. The only way to transfer UDP via USB is in isochronous mode which may fail with quisk, but try it!

213. Re: Quisk / Network

Yahoo group: n2adr-sdr

From: Mario
Topic: 212 Message: 213

Hey Sid,

if the UDP via the USB converter is a problem then probably there is another solution.
Are you familiar with alias IP addresses ?
If your network card is eth0 you may type:
ifconfig eth0:1 192.168.2.200
This should add a net with mask 255.255.255.0 to the eth0 card.
For the switch this should not matter.
Then your PC should be able to ping the frontend.

regards
Mario

Right before my eyes.
192.168.2.192 the USB ethernet IP address
192.168.2.196 HiQSDR
When I get back in this evening I shall make an antenna connection to
the RX port.
~-116dBm with no signal.
73 ... Sid.

Wow, congrats!! It's good to know USB eth works also. Do you use a
switch or crossover cable?

I'm using a 5-port gigabit switch.
I won't be able to make up an antenna lead this evening, my right hand from the wrist to the palm is giving me jip, don't know how I hurt it.
I'm hoping 2 pain killers, some muscle rub and sleep will help.
This may be evolution in action, a human whose right hand is only capable of operating a mouse.

From: Sid Boyce
Topic: 217 Message: 217

I had to use a USB ethernet adapter for the 192.168.2 subnet.
From lusub.
Bus 001 Device 011: ID 07a6:8515 ADMtek, Inc. AN8515 Ethernet
It uses the pegasus driver.
tindog:~ # lsmod|grep pegasus
pegasus 23480 0
mii 13981 2 pegasus,r8169
usbcore 145725 5 pegasus,rtl8187,usbhid,ohci_hcd,ehci_hcd

OS is openSUSE 11.4 Milestone 3 with my vanilla kernel 3.0.0-rc7-smp.

I have my 2-el Quad fed into Bu1, no filters.
Listening on 20m is clean and I've never seen such a clean graph output
on any of the Softrock gear- No spurs.

quisk-3.5.4, sample_rate = 192000.

Next steps, some BPF's and RX/TX switching. I already have a 5W FET PA
from a project of over 20 years ago + LPF's and 140W/300W PA's for later.
Very impressive indeed.
73 ... Sid.

When you check on a softrock you can see spikes with no antenna
connected, clean on the HiQSDR.
I am powering it off a LM317T powered from a 13.8V P.S, +6V to the
HiQSDR, the heatsink is 3 sheets of 6" x 2.5" 18 gauge aluminium bolted
together and U shaped, it gets very warm. I shall put together another
one with a better heat sink.
It's certainly fun.

Hey Sid, congrats on getting it all working!

Yes on the spurs, etc. That's why I kind of gave up on the SoftRocks and other QSD/QSE radios as serious rigs a year or so back. In addition to spurs, you have to balance the sound card (diff phase & gain), etc. Transmit with QSEs can be rather dirty as well, unless properly set up.

I guess that I need to order one of these boards soon. I've been playing with my own stuff, and the Charleston SDR receiver, but the N2ADR design makes a complete xcvr on a board.

Now, if only the cost could come down a little more....
congrats & 73s

Hi Terry,

By using samples and substituting parts it looks like I should be able
to get the cost down to somewhere between $100 and $200. I'm slowly
working on rolling my own board. The going is slow because of other
commitments, bit progress is being made. Low cost and options to
experiment with are my priorities.

73,

Rob

Hey Rob, thanks for working on this. I've been playing with this stuff as well, although I'm not as far along. I've been playing with Xilinx Spartan 3E FPGAs instead of Altera, as a legacy from a simpler SDR designed here in Charleston a couple of years ago (based on the AFEDRI8201).

I really like James' designs, and I use Quisk all the time here.

I have an exciter I designed, also based on the AD9744, that plugged into two Digilent Nexys2 PMOD jacks, and I've used it to learn more about FPGAs. I just this weekend added amplitude control of the RF output by using a PWM generator inside the FPGA, then LPF - similar to the openHPSDR Hermes. That reduced the need for the AD7801 8-bit D/A feeding the AD9744 REFIO input. But, it is more difficult to get the analog filtering correct to both eliminate noise/hash from the PWM, while allowing updates fast enough to be able to tailor CW on/off to reduce key clicks. Using a 50MHz clock for the PWM, and eight bits, I can update the PWM outut every 5usec, which should be fast enough. This may be a waste of time, but again, more FPGA learning!

Anyway, I am looking forward to your work. I tend not to get samples anymore, as I am retired, and do this just for fun. That increases my costs, however.

I'm not sure how much I can help, but I am willing to do so as I can.
73s
Terry, WB4JFI

Hi Rob,

you can make a N2ADR SDR not for 100-200$. Alone the Board, FPGA
and ADC cost are in this range, not speaking of all the other small things. A simple look into the distributors pricelist makes this clear.
Even if you try to hold the quality level high and make no compromise.
Shure, you can get (as example) low cost voltage regulators for 0.50$ instead of $4.50 for a good one - but what price do you pay on the result? There is a reason that a good regulator is not in the <1$ range.

Also, to operate with free samples is not usable for most of the users here - these free samples are payed by all other users - dont you think so? Samples are for development purposes, not to give you a "free of charge" hobby.

SILAB give no free sample anymore - why? hundreds to thousends requests from Hams for free samples of SI570.
Who is paying for that? The serious developers - and last but not least the users itself.

Hi Helmut,

Yes, without free samples, the cost is a lot more, but Terry is a developer and still in the development stages. When a company gets to the production stage as you may be, then parts manufacturers don't give out free samples. It is a trade off when a company like Silabs gives out samples. They gave hams thousands of samples, but they are now have the number one oscillator in ham homebrew projects, and some of those hams are engineers that have likely purchased big quantities of oscillators for other projects because they liked the samples. They don't need the publicity anymore, so no more free samples.

73,

Rob

Topic: 217 Message: 225

Hi Rob,

i do not think that this was the reason stopping samples of the SI-570. I assume it was really the necessary effort to handle all the requests and ship the samples.
Also other vendors stop sampling from time to time when the numbers are getting too high.
I agree with Helmut that a project should not rely on the availability of free samples. For prototypes it can be a viable way.

If it is necessary to get the cost of the frontend down than we should think about which parameters can be relaxed.
Using cheaper regulators may cause the noise to come up. There some investigations may help. Using AD converters which are cheaper ? Probably. For the US hams its certainly a good choice to buy the parts directly in the US and assemble them there. Are PCBs cheaper in the US than in Europe ? I think similar.
You may also save some Euro buying parts in China but then you have the risk just to get samples without function.

In the end its all about finding the correct balance between price and performance.
Cheapest solution is probably something like the guys from the FiFi-SDR project did. High end TRX might be the HPSDR project or the USRP were the prices are much higher than for the N2ADR hardware.

regards
Mario

Hello Helmut and Rob.
Sorry to ignite this discussion. After thinking about it, I don't have an issue with obtaining a sample TI A/D, especially if I design my own board. I already have one of the LTC2208 chips, and actually bought the LTC LTC2208 development board($$$). I am considering the Linear Technology family, the Analog Devices family, and the TI family of A/D parts for the Rx front-end. The big issue is cost to reproduce, not my one-of cost. They are ALL expensive. The TX side is petty easy, I've played with the AD9744 for a few years now.

I also want to use ethernet instead of USB. I've been looking at the Wiznet e'net chips (Wiz5300), as they do the complete TCP/UDP/IP stack in the chip, freeing up FPGA resources. Only 10/100bt, but most FPGA e'net code doesn't do gig-e anyway.

The Charleston SDR was based on the TI AFEDRI8201, which had the whole DDC in a single chip, and at one time cost only $25. The Nexys2 FPGA board only had FIFO and some minor buffering. The limitations were 80MHz max sample rate, and 12-bit A/D. The 8201 is being discontinued (I believe), and the cost is zooming up. The replacement (AFE8220) costs about $55, and that got me thinking about using the more traditional A/D & FPGA DDC design, for not too many more dollars/euros. How necessary is 6 Meter support???

I have the idea that I want a board that will support not only an external host computer (such as current DDCs out there), but will also support stand-alone operation (no PC). In that configuration, the FPGA (plus a dsPIC?) would calculate the FFT values and send them back to the FPGA for display processing on either a standard VGA monitor, or color TFT, similar to the Pic-A-Star group. I have the display FPGA code basicaly working for both those scenarios. FFTs take up a LOT of FPGA fabric!

Then, a second dsPIC would be used (along with a second, narrower DDC inside the FPGA) to filter and demodulate the "signal of interest". The SDR2GO is a dsPIC hardware platform to possibly do this (bypassing their A/D). There would be two modes of operation: 1) the FFT display tracks the narrower demod window, keeping the demod signal in the center of the display; 2) the FFT display stays constant, and the demod window moves within that display, with the ability to move the FFT window as necessary. Very similar to the two display options in Quisk. I have used (and needed) both of these!

I'm tempted to get one of these N2ADR SDRs, and try to implement these ideas with that hardware, but I'm not as familiar with the Altera FPGAs and development tools as I am with Xilinx, plus it would take some cutting to get the necessary number of FPGA pins. To make sure there is NO misunderstanding, I am a total neophyte in ALL this FPGA stuff.

So, sorry to waste some bandwidth here, but I think the N2ADR hardware is presently the closest platform to what I want/need, without rolling my own. I like Quisk, and I like James' xcvr design. I am stuck on the fence right now which way to go...develoment costs are high either way!
73s & tnx for listening.

If you want to grumble about fpga and adc cost, price out an fpga with an x1 PCI-e interface and a couple spare serial I/O interfaces that can run JESD204.

Topic: 217 Message: 229

Hi Terry,

no prob, its very interesting to get a deeper look on your ideas!

I use samples too, but only for development. Most peoples spend not a second for thinking whats happend with the prototypes. Prototyping a design up to a level that it can manufactured and safely reproduced and delivered costs a lot of money & effort. This is quite different to a single proof-of-concept prototype, where you can route dozens of wires, hookups, dead-bug-workarounds and so on...
My goal is to complete the really good ideas and design of Jim to a complete,full usable and reproducable(!) DDC/DUC with all parts that are neededed to be a fine amateur radio TRX

Shure, my target is that (in later days) no pc is needed @ HiQSDR, but i have to do the frontend work first.
Its very interesting, to discuss the ideas and we all can learn from each other!
Specialists like you makes the things going on!
The discussions are the best way to do this!

btw: Ranges. shure, 50Mhz and the LF ranges are not used very often.
But i think that a good amateur transceiver should cover these ranges
if possible. If we do not make transceivers wich covers seldom used ranges, these frequencies will used for other services and are lost to amateurs. No one is buying a separate 50MHz transceiver to be on air.

Best whises for your developments!
Keep us informed!

Helmut, DB1CC

I thought N2ADR transceiver described in the QEX was prior art (HiQSDR

just fine-tuning the layout) and even that was not the first... Maybe

your definition of 'real' is different from mine..

I was a little puzzled by seeing +6V input on the circuit diagram but
wondered why not a +13.8V supply.
Any worries about the extra voltage drop across the +5V regulator?
73 ... Sid.

Topic: 191 Message: 233

Hi Sid,

i would not recommend to do that because of the additional 6W
power that you have to bring away.
Allways depends on how much power you can get away via the flange of the regulator and the size of the cooler and the outer temperature as well. But remind that you have this loss all the time the supply is switched on and probably you want to use the frontend in the summertime in a warm room.

regards
Mario

There is always the cost consideration, but on the other hand I always
had a leaning towards the Hermes/N2ADR idea.

235. Re: [n2adr-sdr] Re: Power Requirements?

Yahoo group: n2adr-sdr
Date: 2011-07-19 23:19:09 UTC
From: Sid Boyce
Topic: 191 Message: 235

I am building a +6V linear P.S but right now I'm running off +13.8V --> +6V using a LM317T and have a good deal of heat sinking together with a PC fan and it's running cool.
I also have a SMPS from a mainframe disk subsystem that I'll see if I can coax it up from +5V (30A) to +6V.

One other thing - has anyone details to share on RX/TX switching and PA chain?
I have a 5W FET PA using 3 VN66AF's, culled from a transceiver I built nearly a couple of decades ago - I last checked it out about a year ago with drive from a signal generator and it still looked good.
I'm thinking of using that to drive an AN762 and later a EB104 if that comes up OK this time. I had to replace Q2 on the EB104 which blasted apart during biassing, hopefully soon I'll get back to biassing it.
73 ... Sid.

237. N2ADR / HiQSDR Power supplies

Yahoo group: n2adr-sdr
Date: 2011-07-14 11:40:46 UTC
From: Helmut Goebkes
Topic: 237 Message: 237

Hi Group,

i followed the discussion about power supplies for the N2ADR/HiQSDR boards last days. In principle, the best solution is a analog series regulator in means of low noise.
On the other hand, this tend to dissapate a lot of heat and needs big Heatsinks.

In my opinion, the best is to combine both worlds. Personally i use for my fixed station a good switching wall power supply (attention: cheap ones produces a broad noise spectrum) with an output voltage of about 6 volts, 2Amps,electronically regulated (!)
Most distrubutors worldwide sell them for some bucks, but often you can cannibalize them from electronic toys or handys.

For portable or mobile use, i would also use a switching high efficiency preregulator. As an example, i setup a circuit diagram of a good and affordable switching supply solution into the files area (DB1CC/HiQSDR-Folder) made around a LM22675. The whole Curcuit has only the size of a Thumb and converts 10..28 Volts into 6.5 Volts with around 1.2 Amps max. Efficiency is >85%.
This is only an example, many other switching preregulators
may work and saves energy (and heatsinks..)

73!
Helmut, DB1CC

OK, I've found that a good heatsink and a CPU fan keeps the LM317T cool.
I've also been able to tweak the SMPS to +6V, it's a VDE certified PS I
have used in the shack at +5V.
73 ... Sid.

239. [Q] anyone build Quisk on Windoze-7?

Yahoo group: n2adr-sdr
Date: 2011-07-17 12:10:40 UTC
From: Ken N9VV
Topic: 239 Message: 239

Hi, I have been trying to install the proper Python 2.7.1 and wxPython 2.8 on my Windows-7 machine to run Quisk with no luck.

I tried various revisions of Python (current is 2.9) but the Quisk installer seems to be hard wired for Python 2.7.

I read the instructions about how to build Quisk from the tarball source. I have MinGW and Qt installed and had successfully built many revisions of the QuickSilver QS1RServer and SDRMAXIV. I know my way around a CLI and proper PATH statements etc.

But I have no success on Windows. Quisk runs beautifully on my Ubuntu 11.10 Oneiric partition, but not on Windoze.

Any suggestions?
thank you,
73 de Ken N9VV

240. Re: [n2adr-sdr] [Q] anyone build Quisk on Windoze-7?

Yahoo group: n2adr-sdr
Date: 2011-07-20 10:51:27 UTC
From: wb4jfi@knology.net
Topic: 239 Message: 240

I have had success building Quisk 3.5.2 on Window Vista 32bit, have not tried Win7 yet. I started with the original SDR-IQ support, added my filter shadow mods, then then added the support for the Charleston SDR. I am stuck figuring out how to package/distribute it without needing recompiles every time, as that's not a Windows user thing as much as Linux.

I just downloaded Quisk 3.5.4 for Linux, and added my usual changes to include the filter shadow, under Ubuntu 10.04LTS. Next, I will get it going on Win Vista.

A little later today, I can fire up the Vista machine, and try to note the development tools and versions. I seem to recall that I used Python 2.7. I have not "spoiled" my two Win7 computers with the proper dev tools (mingw) yet! Maybe in a day or two. My attempt to build Quisk 3.5.2 on one XP box was not successful, but I think that was because of older mingw dev tools from a couple of years ago.

I'm a late-night person, usually staying up until 3AM or so. I'm only awake (sort of!) right now to feed the cats (one is sick), and then back to bed until about noon....

Hey Ken.
As a follow-up, what are your symptoms? Is it building OK, but just not running. or are you having errors?

Two things that I might mention. Please don't take these the wrong way!

1. I noticed that the setup/build file, and possibly others, have conditionals about "win32". I'm not sure how they would react to "win64" versions.

2. The various version of Windows puts user documents folders in various places, and under different names. In my Vista-32 version, I ended up putting my quisk_conf.py file in a separate folder/dir, as: c:\quisk_conf\quisk_conf.py. I then point to it in the desktop icon parameters, by running:
c:\python27\pythonw.exe WinQuisk.pyw -c c:\quisk_conf\quisk_conf.py
In the startup directory:
C:\Python27\Lib\site-packages\quisk-3.5.1

That also answers that I am using Quisk 3.5.1, and Python27.

I found that if I did not specify the proper directory for the config file, everything would build, the I would see a VERY brief flash of Quisk, then it would disappear from the screen.

Both my Win7 boxes are 64-bit, so that may be interesting, once I try one of them.

Hope this helps.
Terry, WB4JFI

Thank you Terry, yes I made (at least) two errors;
(a) had the wrong version of Python and wxPython installed.
(b) your start command is great. My darn conf.py file was
hidden in my Documents\Roaming\khopper\Quisk\conf.py
I will use your -c c:\..... and see if that fixes the
quick flash of an error window.

thanks a million Terry for your specific help. This is
great.

GB you and yours,

Hi, all,

FYI it's just the other way round here, my boards work through straight cables via the switche(s), but it takes a cross cable to directly connect to the PC to work.

E.g. I'm connected to the world via a WLAN link on my laptop and to the N2ADR board via a cross cable to eth0 jack. The routing table has to be modified accordingly (like 'route add 192.168.178.201 dev eth0' in my case, my boards not being programmed to the standard adress).

From: wb4jfi
Topic: 239 Message: 247

Hello Guenter, sure thing.
I modified Jim's original quisk.py Python program to add a slightly different color background on the spectrum display, wherever the radio is tuned to. That different background color follows (roughly) the bandwidth and modulation selected by the user. So, if you have a 192kHz spectrum display on 40M, and are tuned to a signal 3/4 up the display, listening to SSB with a 2.4kHz bandwidth, you will see a slightly different color background starting at the tuned frequency, and going down the scale approximately the received bandwith amount.

Hard to describe, I will try to upload a picture here later today. I have been adding this to Jim's code for a while now. Each version he releases takes me a little time to spot all the changes that I must make, as these changes must monitor the mode, bandwidth, and display selected. It only takes a few minutes to make the mods.

I had been putting the modified file at the Softrock forum, but they ran out of room in their file section. I could put the various modified versions somewhere here, if people are interested. I do have most versions up to 3.5.4 changed. Technically, three files are changed, but the actual filter shadow code is only in quisk.py, with thother two changes one-liners to enable/disable, and choose filter display color. I used lemon_chiffon_3 (or something like that).

You can go to www.amrad.org, click on DSP&SDR on left, and then Charleston SDR, and you should see an older screengrab. It is a pretty small pix, however.

249. Photo of Quisk with filter shadow

Yahoo group: n2adr-sdr
Date: 2011-07-21 20:57:45 UTC
From: wb4jfi
Topic: 249 Message: 249

A little earlier, I put one photo in a WB4JFI folder, that shows the filter shadow runninf with Quisk 3.4.8. For some reason I had problems looking at it afterword.

I can put the modified Quisk files in the files section, under a WB4JFI folder, if there is interest here. Rather than doing diffs, text descriptions, or other stuff, I can just put the modified Python files there, and you can move them into your Quisk directory.

I have them for 3.4.8 (and some otehr older versions), 3.5.1, 3.5.2, and 3.5.4. Once these mods are done onces, it is pretty easy to find the places to put the changes thereafter.

I think Jim does not want to include this option because it may take up too much processing on very marginal machines, and because I did not add the capability to "drag" the shadow and change the automatically bandwidth. I am not a Python expert, so that was beyond my abilities and attention span!

Hi Terry,
You could create a folder in the Files section and place them there.
I've been looking at quisk.py for 3.5.4 and comparing changes with those for 3.5.1 but I didn't cut and paste your stuff in to try. I already have ~/.quisk_conf.py set up and ready.

251. Quisk filter mod files in Files section

Yahoo group: n2adr-sdr
Date: 2011-07-21 21:48:32 UTC
From: wb4jfi
Topic: 251 Message: 251

Please find the two important files that are changed to add the filter shadow in the WB4JFI files folder section. For right now, I only uploaded the changes for 3.5.2 and 3.5.4. I also have the changed files for several other versions (but not every one) of Quisk, starting with 3.4.6. I also included a text file, which shows where the changes were made. Let me know if you want the modified files for earlier versions.

Change the file names to match the original files, such as quisk.py. I always rename the original file first (to orig_quisk3.5.4.py for example), then copy the new file into the appropriate quisk directory, then rename that version, such as quisk.py.

In addition to moving the two files over, you must also enable the filter shadow (the default setting is filter shadow OFF). Do this by adding this line to your .quisk_conf.py file, in your home directory:
filter_display = 1

I also like to click-tune within the displayed spectrum without having the spectrum change. I found this especially useful in the recent 13-colonies event July 4 weekend, where I could put the complete 40M SSB sub-band up on quisk, and then just click-tune on new stations to find out whether they were a 13-colony station or not. I don't run high power and big antennas, so it's important I get to a station like that BEFORE the pileup grows!!! Anyway, to add that click-tuning, put in your {home}/.quisk_conf.py file:
mouse_tune_method = 1

That used to be the default, but changed with recent 3.5.x versions.

These changes also work with Jim's alpha/beta?? Windows version of Quisk.

Also, sorry for all the typos. After a significant computer crash, I am using a new computer and new keyboard. Thank goodness for backups!

Anyway, enjoy.

Terry,
thanks for uploading your changes, very nice work. I got it running allright editing along quick and dirty, however I had trouble with the shadow not following in the zoom feature. Searching around I got confused when reading the JULY 2011 NOTE part. When my version finally agreed to the NOTE text it did not display neither graph nor shadow any longer. Guess I'll have to start over again taking some more time and care.

Guenter:
Thank you for the reminder about the zoom feature! It turns out that I have never used zoom yet, so my changes may not be effective under zoom yet. I will try it with the zoom later today. There is probably a place in the zoom code that needs to have a call to my filter shadow recalculate & display code added to it.

Sorry about that!
Terry

255. Re: [Q] Filter Shadow

Yahoo group: n2adr-sdr
Date: 2011-07-23 19:27:41 UTC
From: wb4jfi
Topic: 239 Message: 255

Follow-up:
I believe that the fix for having the filter shadow is pretty simple. In my def UpdateFilterDisplay() code, near line 503, there is a line that starts:
self.filter_pixels = (application.filterbw / application.sample_rate....

change the firt part of the equation to:
self.filter_pixels = ((application.filterbw / application.zoom) /
(note: you are adding the division of filter pixels by zoom value, don't forget the added parenthesis)

That seems to work OK for me.

One other note that I see. Whenever in mouse_tune_mode = 1 (where you can click around on the spectrum display without moving the spectrum display), if you use the ZOOM feature, it automatically DOES move the spectrum display to center the signal of interest. Once the zoom is set back to 1, the display returns to "normal". This can be a little disconcerting if you are not used to it happening. But, I guess this is better than having the zoom move the wanted signal outside the display during zoom....

I will post a revised quisk.py with teh above changes later today/tonight.

Terry,
tnx in advance. Could it be that your uploaded filter_quiskx.xyz got mixed up - per accident - with the original quisk.py? I can't find your changes in there which is why I started editing. Never mind, no hurry, will standby...

Topic: 239 Message: 258

YES. I screwed up. New version, with mods, just uploaded to files.
Enjoy.
Terry

Hi Terry,

also running on my side now. For some reason i had to change the band before i saw the filter color. This made me do some trials with 3.5.4 and 3.5.2 before i had success ;)
In CW the filter display does not seem to be correct.
The tuning indicator needs to be in the middle of the filter for CW, right ?
Probably your code is something Jim wants to include into his release. Did you already send him this nice stuff ?

regards
Mario

263. Re: [Q] Filter Shadow Changes (Zoom)

Yahoo group: n2adr-sdr
Date: 2011-07-26 00:01:24 UTC
From: wb4jfi
Topic: 239 Message: 263

I thought the CW was the same as SSB, with a CWL and CWU for lower and upper. I can change it if necessary. It already straddles the tuned bandwidth for AM and FM (if FM is there, I forget).

Jim has indicated in the past that he prefers not to include it, as I mentioned a few days ago. It can use significant processing on marginal computers to "fill" the background. Plus, He said a while back that since I did not implement a "grab and drag" to be able to dynamically change bandwidth, he thought it would be confusing. Quisk is HIS software, so he gets to decide!

tnx.
Terry

264. Filter shadow line color (should be red)

Yahoo group: n2adr-sdr
Date: 2011-07-26 03:58:43 UTC
From: wb4jfi
Topic: 264 Message: 264

Thanks to Detlef, who pointed out that I had accidentally changed the "tune line" to black, from its original red, when I put in my filter shadow mods. The line is red while tuning, but turns black when tuning stops... I get confused each time that I change that code, and added/subtracted/added lines too much there!

The fix is pretty easy. Around line 437 in my modified quisk.py file, there is a line that says:
dc.SetPen(wx.BLACK_PEN)
Comment that line out (put a # in front of it), or just delete that line. It should be immediately after a line (436):
dc.SetPen(self.tuningPen_Tx)

Line 436 sets the color correctly, I'm not sure why I changed it to black, probably some confusion earlier on. OF course, this may be an erroneous fix...

I will clear this up in the files section in the next day or so, and clean up my future mods.
tnx & 73s
Terry, WB4JFI

265. New Quisk Version 3.55 / New Firmware for HiQSDR available

Yahoo group: n2adr-sdr
Date: 2011-08-01 07:57:16 UTC
From: Helmut Goebkes
Topic: 265 Message: 265

Hi Group,

A new firmware-update for the N2ADR/HiQSDR is available.
The firmware V 1.1 supports the new features of the HiQSDR-Module like
preselector-switching, Attenuator settings, Antenna switch a.s.o
the new HiQSDR Preselector/Preamp Board uses this lines for switching.
The firmware is tested with both versions and works without problems.
The New firmware is needed only if you use the improved features of the HiQSDR Board, but is compatible with the original N2ADR-Board as well.

Also, Jim programmed a new Version of Quisk to support the HiQSDR features. the new version is numberd 3.5.5.
Quisk has now a PTT-Button who can be used as remote TX control
and the separate hardware Key-Input and PTT input of the HiQSDR
is now supported.
The Hardware Key-Input is now only for CW-keying, the hardware
PTT is only for non-CW-modes so it is not longer necessary to use the CW-Key as PTT.
The Attenuator has a separate button to select 0dB (pass-thru)
+10dB (Preamp on, this switches the Preamp @ Preselector-board)
or -10dB/-20dB/-30dB attenuation.
The valueas are editable via the quisk-config.py.
Also a separate button is available for antenna switching.
If the antenna switching does not work correctly, please replace
the relay driver T4 (BCR148W) with a BSS138, some BCR148W makes problems.

Please see Jim's notes below to Firmware / Quisk release:

73
Helmut, DB1CC

******

Quisk Version 3.5.5 July 2011
==========
These changes only affect the N2ADR 2010 transceiver and the improved version, the HiQSDR.

I moved all the files into a new package directory hiqsdr. The old n2adr directory has only the special files I use at my shack.
Please change your config file as follows:

```
from hiqsdr import quisk_hardware # Special hardware file
use_rx_udp = 1 # Use this for the N2ADR-2010
use_rx_udp = 2 # Use this for the HiQSDR
```

The sample config file quisk_conf.py in hiqsdr can be used as is for the HiQSDR. There is a new dictionary tx_level in the config file to set the transmit level. See quisk_conf_defaults.py for other features that can be set for the HiQSDR.

There is a new FPGA firmare version 1.1 available to support the new HiQSDR features. Note that your firmware version is shown on the Config screen. It is not necessary to update your firmware unless you use the HiQSDR and you want the new HiQSDR control lines to work. If you do update your firmware, you must run Quisk 3.5.5 or later.

An interesting video. I'll have a look at HiQSDR later today to see how
it compares.

Looks like Jim has as expected been doing some great stuff.

I wonder what programmer is recommended? Looking at cheap there this
from Sparkfun Electronics which I hope I could use with a
USB-to-parallel cable..

Altera FPGA Compatible Programmer

sku: PGM-08705 <http://www.sparkfun.com/static/rohs/>

Description: The Altera Compatible Programmer is Sparkfun's version of
the Altera ByteBlaster Cable. There is a 25-pin D-Sub connector for a
PC and a 10-pin interface to the FPGA.

Note: The programmer does not come with the 10-pin IDC cable.

This one looks like a more suitable device and connects via USB. At $79.00 probably preferred to the Sparkfun version.

Hallo Helmut,

vielen Dank für den Hinweis.
Das ist ja klasse, dass alle Funktionen unterstützt werden.
PTT aus Quisk heraus ist auch nicht schlecht. Gab es eigentlich einen PTT Ausgang an der Frontend Platine ? Wahrscheinlich schon.
Ich bin noch am bestücken Deiner Platinen.

Gruß
Mario

Hi, all,
trying to run quisk-3.5.5 I'm stuck at line 25 with
Import Error: ./ _quisk.so: wrong ELFCLASS: ELFCLASS64
Before contacting Jim: Anyone any ideas?

Hi Guenter,

seems Jim has a new 64bit PC now.
I had same problem here.
You need to recompile typing "make" in the quisk directory.
Probably you need to install some more libraries as indicated at Jim's website.

regards
Mario

Hi, Mario,
right you are... what I had installed was the wrong portaudio version, it had to be the 1.9-dev package before it compiled OK. Tnx es 73

There is a new dictionary tx_level in the config file to set the transmit level. See
quisk_conf_defaults.py for other features that can be set for the HiQSDR.
> > >

Hi Mario, Hi Guenter,

i tested the 3.5.5 Prerelease Version last week without any problems.
I Installed 3.5.5 on two PC's, a AMD I965, 3200MHz under Windows7 Ultimate 64 Bit and Ubuntu 11.x, both up and running from the first time on.
On a second PC in my lab (an intel i5), the installation under Win7 32Bit runs also without problems.

73!
Helmut, DB1CC

Probably the need to recompile is just with Linux 32bit systems.
I had to recompile for my x64 PC before 3.5.5 as well.

I have always recompiled. I have x86_64 boxes running openSUSE and Kubuntu.
When I ran quisk and HiQSDR on one openSUSE box, audio came in short
bursts, USB related. On the other openSUSE box and using the same type
of USB ethernet dongle, no problems.

Last night I fired up quisk-3.5.5 on the working box and it's fine.
When the EEBlaster arrives I'll have a go at uploading fgpa-1.1. I have
the Altera free software installed on openSUSE and have been having a
look around it. It's still not clear how to use it as there seems to be
no GUI. The files I have
total 52
-rw-r--r-- 1 root root 0 May 23 04:06 instanceguid.txt
-r-xr-xr-x 1 root root 2284 May 23 04:06 jtagconfig
-r-xr-xr-x 1 root root 2284 May 23 04:06 jtagd
-r-xr-xr-x 1 root root 2284 May 23 04:06 qcpfw
-r-xr-xr-x 1 root root 2284 May 23 04:06 qcse
-r-xr-xr-x 1 root root 2284 May 23 04:06 qpgmt
-r-xr-xr-x 1 root root 2284 May 23 04:06 qreg
-r-xr-xr-x 1 root root 2284 May 23 04:06 quartus_cpf
-r-xr-xr-x 1 root root 2284 May 23 04:06 quartus_jli
-r-xr-xr-x 1 root root 2284 May 23 04:06 quartus_pgm
-r-xr-xr-x 1 root root 2284 May 23 04:06 quartus_pgmw
-r-xr-xr-x 1 root root 2284 May 23 04:06 quartus_stp
-r-xr-xr-x 1 root root 2284 May 23 04:06 quartus_stpw
-r-xr-xr-x 1 root root 2284 May 23 04:06 tb2_install
Perhaps when I attach the EEBlaster all will come clear.
73 ... Sid.

281. HiQSDR informations

Yahoo group: n2adr-sdr
Date: 2011-08-05 05:47:21 UTC
From: Helmut Goebkes
Topic: 280 Message: 281

Hi Group,

to make it easier für you to get all informations / docs
about N2ADR / HiQSDR, i setup two internet domains:

www.hiqsdr.de and www.hiqsdr.org

Here you will find the aktual files, circuits, links and informations
about the N2ADR/HiQSDR DDC/DUC Transceiver for download / review
additionally to this yahoo-group.

best regards & 73!

Helmut, DB1CC

My EEBlaster was delivered today.
It seems I would need an adapter to hook it up to the HiQSDR. I've
checked the RS Components site but couldn't find any connector of the type.

From: Sid Boyce
Topic: 217 Message: 283

I have one box running fine with the AMDtek USB ethernet. BTW the driver
is the dm9601 not the pegasus.
Connecting so far to 2 other PC's and a laptop with these adapters, I
seem to be getting a lack of bandwidth problem.
It's as though the USB system or powered hub, where used, isn't able to
keep up with the rate and both audio and the graph are extremely jerky.
So one box is OK and 3 not OK.
I've got a spare D-Link DGE-528T Gigabit card I'll try in one of the
boxes tomorrow.

Hi Sid, You will need to make an adapter lead. The mating part for the board connector is RS part number 301-8098, you will need a 2x5 pin header to mate with the EEblaster, RS part number 251-8143. I'm not sure why Helmut used a non-standard JTAG connector on the HiQSDR board.

My EEBlaster was delivered today.
It seems I would need an adapter to hook it up to the HiQSDR. I've checked the RS Components site but couldn't find any connector of the type.

Hi Sid, Hi Peter

i used for FPGA programming also a 10-pole micromatch
connector becvaus the "Standard" 2x5 Pin JTAG was too large
to fit the board.
You can use a simple 1:1 pin connector, the pinning is identical.

290. Re: New Quisk Version 3.55 / New Firmware for HiQSDR available

Yahoo group: n2adr-sdr
Date: 2011-08-12 05:12:25 UTC
From: Mario
Topic: 265 Message: 290

Hi,

yesterday i flashed a new FPGA image (version 1.1) to my N2ADR board.
In general it works fine.
When i switched the hardware to mode 2 (HiQSDR) i was wondering, why QUISK stopped decoding immediately after starting. Then i noticed that i need to press the FDX butten when SSB is selected. Could it be that FDX and PTT buttons are swapped ? I did not change anything else in QUISK or in the FPGA design.

regards
Mario

Hi Mario,

it looks like that you activeted any PTT (external on HiQSDR
or via Software) to make HiQSDR to transmit.
If PTT is activeated, Quisk stops decoding except you press the FDX button for full-duplex operation.
The only difference in PTT/CW behaviour between Quisk 3.5.4 and
3.5.5 and Firmware 1.0 and Firmware 1.1 is, that the PTT and CW-Key
connections at HiQSDR (in Hardware) bound to their corresponding Modes.
That means, that CW-Key activeates transmitter only in CW modes, all other modes needs the PTT-connections to be active for transmission.
The PTT-Button in QUISK 3.5.5 switches always to transmit, independent
of the selected Mode.

Mario, pse check you PTT connections, it seems that you are in transmission...

295. Re: [n2adr-sdr] Help - Programming the HiQSDR FPGA

Yahoo group: n2adr-sdr
Date: 2011-08-18 20:50:48 UTC
From: Sid Boyce
Topic: 293 Message: 295

Using XP, the Programmer Window is as shown below.

```
Programmer - H:/Transceiver/Transceiver - [Transceiver.cdf]*
------------------------------------------------------------------------------------------
------------
Hardware Setup USB-Blaster [USB-1] Mode: JTAG
Progress: (Failed)
File Device Checksum Usercode
Program/Configure (rest unticked)
Transceiver.sof EP3C25Q240 00AEFE6E FFFFFFFF (ticked)
|------------------|
TDI ----------> |------------------> TDO
|------------------|
EP3C25Q240
```

When I click on "Start" the EEBlaster "Prog" light flashes and "Failed"
appears in the Progress box.
Are there any discrepancies seen in the above setup -
File/Checksum/Usercode?
73 ... Sid.

298. group deathly silent

Yahoo group: n2adr-sdr
Date: 2011-08-24 15:31:32 UTC
From: Sid Boyce
Topic: 298 Message: 298

Perhaps everyone is on holiday.
Having got the RS Components 301-8098 PCB micro plugs I discovered
yesterday that they stock the IDC plugs 301-8133.

I did get the FPGA pogrammed successfully under Linux with the command line.
slipstream:/home/lancelot/ftp/aug11/TRANSCEIVER/Transceiver #
quartus_pgm -c USB-Blaster Transceiver.cdf

I heard from Jim "The Mode should be "Active Serial Programming". And
the device is EPCS16, the flash chip."
Just before I heard from Jim I did some more reading of the Altera
manuals and realised from a table that JTAG was not correct.
That was my problem under both XP and Linux.
BTW the GUI on Linux and XP are identical.

Making a symlink of linux64 to linux cured the message that there was no
linux64 directory on this platform.
slipstream:~/altera/11.0/quartus # ls -l linux64
lrwxrwxrwx 1 root root 5 Aug 18 21:53 linux64 -> linux

So far other stuff done.
* Built a +6V LM338T supply (5A) to allow elbow room for add-ons.

* Took a 10W PA from a transceiver I built in 1983, wired up to be
tested with signal generator and dummy load hopefully tomorrow.

* A tunable preselector for 160m - 10m also from the old transceiver
project to be wired in.

* A AN762 PA with LPF's needs wiring up the vacuum switches for RXTX.

* A EB104 PA to be biassed. Q2 blew apart when biassing it, now replaced.

*** The USB ethernet dongle seems to have died and 3 others I have tried
don't seem to be capable of handling the throughput. they all cause
short splotches of sound, so are not usable.

I just received a Yahoo Update message saying that I just uploaded some new images. Only, I haven't. It's been over a month or more since I've uploaded any pictures.....

I'm going through some house work right now, but plan to update the latest Quisk version with the filter shadow when I can. At least, if there is interest in that!

No problem Rob,
Though it's easy, the documentation is scattered around several manuals
and in parts it leaves you still short of fully worked out examples
needed for a full understanding.
Perhaps it's intentional, encouraging enrolment in a course.
In the good old days we at Amdahl used to offer free courses but when
mainframe prices no longer exacted a premium, we took a leaf out of
Sun's book and started charging. For Sun it was a good revenue stream.

305. Uploaded Quisk 3.5.5 Filter Shadow Mods

Yahoo group: n2adr-sdr
Date: 2011-08-28 22:37:41 UTC
From: wb4jfi
Topic: 305 Message: 305

I just modified and uploaded the Quisk 3.5.5 to add the filter shadow. There are two files that need the modifications (assuming that you already modified your ./.quisk file). Look in the WB4JFI file area for a quisk3.5.5 folder.

Rename them to the quisk.py and quisk_conf_defaults.py files as you move them to your quisk folder. As a reminder, I usually rename the originals to orig_3.5.5_quisk.py and orig_3.5.5_quisk_conf_defaults.py before putting the new ones there.

I also included my internal text file, which shows where each modification goes. There is still one step that is messy, but I am cleaning it up now for the next version.

Please let me know if you find any issues.
Thanks & 73s
Terry, WB4JFI

Hello Terry,
works fine on Quisk 3.5.5 with Debian Linux and AMD2400.
Don't forget to set filter_display = 1 in .quisk_conf.py
At my first run i forgot to set the parameter filter_display.

Many thanks 73 de DG7MGY Hubi

I cut and pasted the filter section to the end of the .config, a copy of
n2adr/quisk_conf.py in 3.5.5.

309. quisk PTT question

Yahoo group: n2adr-sdr
Date: 2011-09-06 03:20:24 UTC
From: Sid Boyce
Topic: 309 Message: 309

Does quisk provide a PTT signal or does it require activation via J1?

I've checked out a 5W and a 15W PA using the signal generator so TX is next on the cards, first with those PA's standalone and then the 15W --> AN762.

The attenuation from the variable BPF out of the old transceiver is excessive though it's supposed to be 50 ohm in/out I think, can't find the circuit diagram for it. I'll put it on the miniVNA Pro to see what I get.
73 ... Sid.

310. Re: quisk PTT question

Yahoo group: n2adr-sdr
Date: 2011-09-06 13:38:43 UTC
From: Helmut Goebkes
Topic: 309 Message: 310

Hi Sid,

you can activate PTT via J1 (Pin1,Pin2)or from Quisk if you press the PTT button (Quisk Version > 3.5.5) This true for all Modes exept CW
because CW Transmission is activated by activating J1 Pin 3/Pin4
(Key input)

To control a PA or a RX/TX-Relay, you can use the signal on
X1, Pin6 wich is "/TX_ACTIVE", a low active signal wich is always low if tx (mode independent)is active. Be carefull, because this digital signal comes directly from the FPGA and is a bit sensitive! Do not apply any voltage >3.3V to this output!

73!

Thanks Helmut,
I already have a 5V RXTX relay wired up so I should be able to use X1 Pin6 to switch the relay via an invertor and LM10 or BS170 FET.

Helmut,
I have been cross-checking between Jim's pinouts for quisk-3.5.5,
TARGET_ HiQTRX_V24T_Circuit.pdf and what's written below, i.e X1, Pin6
for /TX_ACTIVE. It seems the circuit diagram needs revising.
Jim's pinouts tabulated

X1 pins 1-4 FPGA pins 69, 68, 65, 64 Bandswitch
5-6 63 Preamp
7 57 TX LED
8 " RX LED

84, 83, 82, 81, 80 Atten
41 Antenna Switch

J1 1-2 176 PTT SSB
3-4 177 KEY
---
73 ... Sid.

Hi Sid,

>It seems the circuit diagram needs revising.

Yes i know, but there is no real change in the circuit diag except the name (and function because of the Firmware change) in the circuit.
Anyway, i will revise circuit diagram next days and update it
in the net.
I have also to revise the text portions and descriptions partly, but due to massive QRL currently i have not enough time to do that (snif)

315. FW update

Yahoo group: n2adr-sdr
Date: 2011-09-07 13:19:45 UTC
From: sergeapm
Topic: 315 Message: 315

Hello to all

Sri but didn't see a lot of information about programmer and some questions not clear.
It is therefore understandable that this - study and try all by myself.
Thanks Sid G3VBV for his assistance with messages-questions and for help with connectors ,

Now programmed the new 1.1 version and run HIQSDR on Windows 7 32bit - it was really easy ,except solder jumper 2x5 connector to cheap China Altera USB Blaster - which work OK for 15 USD shipped

successfully tested HiQSDR through router Asus500 and Dlink D615 on wifi - not so bad - Hammond 1455L1201 - 1455N1201 seems good for box
I lost just 10 minute for short manual about some FAQ
pse see my pictures-manual in file section RV3APM
i hope it will help someone

73 Serge

316. Quisk and Win7/64, installation recipe wanted

Yahoo group: n2adr-sdr

From: Guenter DL7LA
Topic: 316 Message: 316

Hello all,

I was asked to forward a question by Klaus, DK7XL, moderator of a German SDR forum. Although they primarily focus on PowerSDR he would like to know if quisk has been successfully installed and if so, whether someone (here) could offer a sort of cookbook recipe for the Win7/64 bit environment.

This is not urgent at all, a success message alone will be great. I'm running a 32 bit Version of Win7 and won't be able to change back to 64 before about two weeks time. I remember there was an issue when I tried on 64 for a fellow ham but can't remember exactly what went wrong then. I'll install Win7/64 here later anyhow and will report then.

Glad to hear FPGA is at 1.1 now.
The problem with the Altera documentation is that it is scattered over several manuals addressing the various devices.
With google search thanks to a post to the HPSDR group I got it programmed under Linux with "quartus_pgm -c USB-Blaster Transceiver.cdf".

After successfully using the command line and asking Jim for help - ASP is the method, but still no idea of how much memory to tick.

For the GUI (Linux and Windows are identical) - It took a long search through the manuals to eventually find a table listing that the interface is Actve Serial Programming but nowhere could I find out how much memory to specify for ASP.

It's all part of the learning process I suppose. The jumper was the easy part.
I ordered the EEBlaster not realising I had already ordered the Chines clone until it turned up a week after the EEBlaster. Both do the same job equally well.
73 ... Sid.

Topic: 316 Message: 319

Hi Günter,

the current Windows release of Quisk is 32bit but runs under 64bit as well.
Of cause you need to install 32bit python and wxpython 32bit.
On my Win7 x64 PC i have the problem that Quisk does not run if the microphone is enabled in Quisk config. So TX is not possible here. But Helmut reported that this might differ from PC to PC.
Furthermore the Windows version of Quisk is still kind of a beta.
I have no clue how to recompile for x64 Windows.

regards
Mario

320. Quisk connect audio to other software under Linux ?

Yahoo group: n2adr-sdr
Date: 2011-09-08 12:13:09 UTC
From: Mario
Topic: 320 Message: 320

Hi,

i tried to get the audio from quisk to another software under Linux Ubuntu 11.04 but was not successfull so far.
I understand using a second soundcard would be easy but i like to get the audio forwarded internally.
I tried to establish a link from Alsa to the Jackd and obviously some samples were forwarded from Quisk via Alsa to Jack and played at the soundcard. Unfortunately the audio was corrupt. I did not search for the reason so far. Probably sample rate issues ?
The other chance might be to setup a virtual soundcard in the alsa configuration. Until know i have understood how to do this ;)
Third option: I already had a successfull link between Quisk and pulseaudio via a link over Alsa. Unfortunately this stops working after a few seconds.
The best choice might be implementing jackd support into Quisk ;)

Was anyone more successfull than me ?

regards
Mario

Hi Mario,

I second your suggestion of adding JACK support into Quisk. I just did
this for John Melton's ghpsdr (Alex's branch), and it wasn't that difficult.

https://github.com/alexlee188/ghpsdr3-alex

See the aconf branch if you are interested.

Hello Mario,
i have the same problem to and from my opinion jackd was
a good way to connect audio recorder or fldigi to Quisk.
Fldigi has jackd implemented.

For digital modes are needed only HiQSDR mode ptt and frequency control from fldigi and a jackd connection to Quisk.

We should talk with Jim N2ADR if its possible to take the jackd code
to the official Quisk version.

At the moment i work with two soundcards and a cable between it works but was not nice.

Hi Hubi,

in general i got the interface to jackd working. I added a PCM device with type of the jack plugin to .asoundrc. It is important to switch the sample rate in jack to 48kHz. This was the problem that caused the interrupted audio. Unfortunately after a few seconds the audio playback crashed and jack prints many errors. Probably that has something to do with Quisk itself. The the "noise" in the RX audio when playing directly to alsa is probably a problem within Quisk that cannot be managed by jackd ?
At least i was able to see the output of quisk within fldigi for a very short time.

regards
Mario

After quite a while of unsuccessful testing i found a way to connect Quisk to other Alsa capable software at least.

You just need to loard the alsa loopback "soundcard" driver:
sudo modprobe snd-aloop

Then two additional devices should appear. Probably you have to restart alsa with
sudo alsa force-reload

You can select one of the new alsa devices for quisk audio output and the other one in the software of your choice (i tried with fldigi).
Afterwards in the second software the audio from quisk appears.
Unfortunately i was not able to get audio out of the speakers at the same time.

Take care that the alsa device numbers may be in a different order after rebooting or even restarting the alsa.

regards

That's what I've been working on this afternoon.
Cable to X1 built and checked voltages.

RX/TX relay switching circuit worked out - to be built. X1 pin 6 -->
74LS04 --> VN10KM or VN10LM driving the relay.

Attenuator to be built with 0.6W resistors. I need ~13dB of attenuation
to provide ~300mV drive for the PA.

15W PA ready to go with bias applied via a toggle switch initially when
the above completed.

I agree Ken, it would be nice to know what others have done and achieved
with TX.
73 ... Sid.

Hopefully I'll have more to say soon.

Very interesting Mario. The alternatives to using quisk with jack was a topic of a private discussion I had recently with a guy in VK. We thought of aloop but we didn't actually try it.

Normally the devices come up the same unless something changes like in my case if I come up with the USB camera disconnected another sound device will claim its place. It's possible that a udev persistent-snd.rules file could assure fixed device nodes for it - again not tried. In such a case I have changed ~/.quisk_conf.py.

The only other software I've looked at briefly was Linrad but I got no audio locally. Perhaps Linrad would need to be capable of interpreting the packets it receives. When modified for the HiQSDR ports and IP address it seems to accept the packets.

What would be interesting also would be hamlib support.
For Softrocks sdr-shell output is patched to fldigi using jack. I don't think anyone has tried to do it for quisk.
73 ... Sid.

I would think that a way to get Quisk to work with jack would be to use the jack interfacing code from sdr-shell. It has all the right stuff for handling the circular buffers, flags, etc already proven to work. It may take a little bit of work to interface that to quisk, but the payoff would be good.

Subject: Re: [n2adr-sdr] Re: Quisk connect audio to other software under Linux ?

Very interesting Mario. The alternatives to using quisk with jack was a topic of a private discussion I had recently with a guy in VK. We thought of aloop but we didn't actually try it.

Normally the devices come up the same unless something changes like in my case if I come up with the USB camera disconnected another sound device will claim its place. It's possible that a udev persistent-snd.rules file could assure fixed device nodes for it - again not tried. In such a case I have changed ~/.quisk_conf.py.

The only other software I've looked at briefly was Linrad but I got no audio locally. Perhaps Linrad would need to be capable of interpreting the packets it receives. When modified for the HiQSDR ports and IP address it seems to accept the packets.

What would be interesting also would be hamlib support.
For Softrocks sdr-shell output is patched to fldigi using jack. I don't think anyone has tried to do it for quisk.
73 ... Sid.

On 10/09/11 16:22, Mario wrote:

After quite a while of unsuccessful testing i found a way to connect Quisk to other Alsa capable software at least.

You just need to loard the alsa loopback "soundcard" driver:
sudo modprobe snd-aloop

Then two additional devices should appear. Probably you have to restart alsa with
sudo alsa force-reload

You can select one of the new alsa devices for quisk audio output and the other one in the software of your choice (i tried with fldigi).
Afterwards in the second software the audio from quisk appears.
Unfortunately i was not able to get audio out of the speakers at the same time.

Take care that the alsa device numbers may be in a different order after rebooting or even restarting the alsa.

From: Mario
Topic: 320 Message: 330

Hi Terry,

i agree that a direct link to Jack would be very beneficial. I already tried the indirect way with the Alsa-Jack link. Unfortunately the plugin crashes after some seconds when the samples come from Quisk.
I did not look to the stuff from SDR-shell but i also found a library named pyjack that could be used as well. So we need someone who has experience in this area ;)
I just posted this solution as an intermediate way to interface to other software (although its not very comfortable). Yesterday i tried with the Dream DRM decoder and found that it works very well.

regards
Mario

Thanks I checked a few days ago to see if there was anything later.
Just fired it up on the HiQSDR.
This is the first version to give realistic S-meter readings.
I need to have a closer look to see how to turn on PTT, it came up in
white and not changeable.

BTW, I've been trying to build qsdr on openSUSE, just to see what it
offers but I get errors.

```

From: Andrea Montefusco
Topic: 333 Message: 333

Hi all,

could someone give some explanations/pointer to qsdr software ?
I was able to find only german pages at http://dvbh.kilu.de/qsdr/

TIA

Indeed, it's a bit cryptic, no author, no references. 'kilu' seems to be a free website provider, and download is pretty slow. I'm trying my luck in finding some info in the sources. The other FA-SDR rig mentioned is a project of the German magazine 'FUNKAMATEUR'. They are using simple hardware in a zero-IF radio together with a Si570 f*4 oscillator. Looks like the author adapted some gnu-radio concept to the N2ADR ethernet hardware.

338. Slow RX/TX with this circuit

Yahoo group: n2adr-sdr
Date: 2011-09-22 22:29:39 UTC
From: Sid Boyce
Topic: 338 Message: 338

X1 pin 6 --> Gate of BS170 level shifter (Drain to +5V via 10K) --> 2 cascaded stages of 74HC14 (+5V powered) --> 1K --> BS170 Gate, Drain to Relay with back EMF diode -> +12V.

Clicking PTT in quisk, pick and release of the relay takes around 3.5 seconds each way.
Any suggestions as to how this could be speeded up.
I've not yet checked to see if there is a delay in in the rise and fall of the PTT signal.
73 ... Sid.

Topic: 338 Message: 339

Hi Sid,

maybe the BS170 is not the right choice, because the output of the FPGA delivers just CMOS levels of 0 and 3.3 Volt at this pin.
BS170 Specs shows that the gate voltage is min. 3V, so
maybe the FET switches not correctly. Try a BSS138 for this or
any other low gate voltage N-Channel FET.
Best check is to trace the signal path with a Oscilloscope..

73!

Hi Helmut,
I have a quick question for you.Since the ADC needs a full range signal to have the best SNR how did yoy succed to do that with only a small (i think 20dB) amplifier as front end ?
Considering a 20dB gain in font of the ADC, this means a voltage gain of 100 times the voltage at the input. Practically speaking 1uV signal at the input will be like 100uV after the gain stage and this is delivered directly to the ADC. It is enough for the ADC to work with this reduced voltage scale ?
Regards,Cristian.

Hi Sid,

maybe the BS170 is not the right choice, because the output of the FPGA delivers just CMOS levels of 0 and 3.3 Volt at this pin.

BS170 Specs shows that the gate voltage is min. 3V, so

maybe the FET switches not correctly. Try a BSS138 for this or

any other low gate voltage N-Channel FET.

Best check is to trace the signal path with a Oscilloscope..

73!

Hi Christian,

i think you are mixing up the things a little bit.
Of cause the ADC reaches best signal to noise if the input signal uses the full scale. But that is not what you need to have.
The signal you are sampling is the wideband sum of all the signals that come from the antenne (through preamp, preselection filters etc.)
The largest signal of these must not be bigger than the maximum input voltage of the ADC.
Of cause there can be other signals that are very weak and the readability depends on the effective resolution of the ADC. The ADC should have linear resolution steps and therefore a small signal is not a problem if the resulting resolution is enough for demodulation/decoding.
Keep in mind that the frontend gains resolution by decimation of the sampled signals. This means more or less reducing the bandwith of the received signal and getting more resolution instead.

Regarding the 20dB: 20dB is a power gain of 100. Voltage wise this is 10. As Jim, N2ADR states on his webpage the gain of the preamp is probably too low to get full sensitivity on the higher shortwave bands. Since the noise on the lower bands is much higher it is ok there. He had chosen the gain in order not to limit the dynamic range.

regards
Mario

From: Marciniak, Ed
Topic: 338 Message: 344

Above a certain frequency where the atmospheric noise floor has fallen enough for the noise PSD to be less than the ADC noise floor, it is inevitable that an increase in signal to noise requires frequency selective gain and likely trade of either dynamic range or bandwidth.

Consider the case of a VHF IF in a cellular base station with a SAW filter, mixer, filter, and preamp.

345. small bug in Quisk Version 3.5.6

Yahoo group: n2adr-sdr
Date: 2011-09-29 05:20:23 UTC
From: Mario
Topic: 345 Message: 345

Hi,

if the current version 3.5.6 is started with soundcard as input device for the samples there is a small bug that prevents Quisk from starting.
I asked Jim and i quote his answer here:

"...
This is a bug. The solution is to change quisk.py line 1445 from

self.sidetone_volume = 0.0 # Set sidetone volume, 0.0 to 1.0

to this:

self.sidetone_volume = 0

Thanks to Leigh.

Jim - N2ADR

Hi Christian,

Mario told you the specifics and he is absolutely right.
To get better S/N at higher frequencies and be more selective to amateur bands, i am working on a Preselector/Preamp/Driver extension for HiQSDR. This extension Module holds Band specific modules with sharp Bandfilters for all Amateur Bands separately and a switchable ultra-low-noise preamp (Analog Devices) as well as a 1W-PP-driver for the TX-path. All Band filters are on pluggable modules with several control signals @ the connectors to allow active Bandfilters (for LF) and Converter modules (for VHF). There are 12 Module places who can populated with Filter / Converter modules and selected by the HiQSDR FPGA and controllable via Software.

The Band filters itself are calculated as Hi-Q Elliptic Cauer 5/7-pole types and contest proof.
All modules are RF-switched with integrated, terminated SPDT
RF-Switches from HITITE (to avoid >30 relays...) except TX-Driver who is switched by Omron HF3 RF relays.
With this board you can use the full advantage of HiQSDR in a very distorted area (like contests or in neighborhood of a BC-TX) without problems. Also on this board all switching electronics is contained for a timed control of a (later coming) 100W-PA. There are three antenna connectors, the used antenna connector and is programmable for each module.

Also you can use the Preamp/Driver extension module with a HiQSDR main module to be a complete QRP DDC/DUC TRX.
Currently i am doing the layout, in approx. two weeks the work is completed and presented here.

Best regards & 73!

Helmut, DB1CC

Hi Helmut,
Thanks for your replay.
Curently i'm designing also a board That will have the capability of working in 144MHZ , 432MHZ ,1296MHZ and 2400MHZ.The first IF is 170,6 MHZ (filtered with SAW or wider analog filter) and the second one is 14,318 MHZ. This will go into a AD9460 fron Analog Devices (16 bit 100MS/s) and AD9744 DAC for TX purposes. There is alse an analog SSB tx/rx path since i don't intend wriight now to generate digitally those signals but to have only the possibility to "sample" the received signals. After that... all comes in software.
All LO's are PLL's (ADF 4113)with Crysteck oscillators using as a reference a DDS (AD9952) in order to have fine steps.
The FPGA is a Xilinx in this case ann also with a little help from a AVR32 i hope to make FFT calculations for panoramic screen over each band.

Regarding the firmware insede the FPGA and QUISK i think these are the most valuable parts of the project.
Regarding my question in the previous E-mails i thoght that is necessary to have a little more gain in the superior bands.I supose this come with the new TX/RX front-end.
I like very much your project and i apreciate very much your work.
Cristian,YO3GIV.

Excellent news Helmut, looking forward to it.

Got a crazy problem on the 192.168.2 network where I can't ping anything attached to the switch. Tried another switch but it's the same. I'm stuck until I can find out how the latest openSUSE update has screwed this network.
As much as I'd hate to, if unresolved I'll try network aliasing on the primary card and have everything attached to that 16-port gigabit switch.

When I had a working setup, I built 3 BPF's for 40m - 10m and checked all the bands a few days ago when they were all active.

There is one thing noticed only on 12m. With no BPF the graph starts off level below the band edge and rises from the band edge to the end of the display - Like if it starts off at -110 dBm it rises across and up to -40dBm, with the BPF it's very much better. The effect is still there but greatly reduced.
73 ... Sid.

357. Quisk 3.5.7 modified for filter shadow

Yahoo group: n2adr-sdr
Date: 2011-10-25 21:30:13 UTC
From: wb4jfi
Topic: 357 Message: 357

I just uploaded the two main modified Quisk files to add the filter shadow, plus the text file describing my changes. Just put these in your main quisk directory, and rename them to replace the originals (after backing up the original files). If you haven't run a previous modified version of Quisk, you will also need to modify your personal quisk config file, per the last instruction in the text file.

Also, has anyone noticed some audio stuttering with Quisk 3.5.7? I'm using the Charleston Rx1 as the hardware, and now hear audio stuttering and breakup at 192ks/s, which I have not heard before Higher sample rates show the descrepency even worse. The CPU load is about the same as 3.5.5 (2 CPUs, anround 40-50%), and I'm not seeing significant errors on the Config page (comparing 3.5.5 and 3.5.7), so it doesn't look like the usual suspects. I don't hear any problems at all when running 3.5.5 alternately on the same computer. The test machine is a Sony Vaio laptop, running Ubuntu 10.04LTS.

Thanks.
Terry, WB4JFI

One problem in the filter file, causes and indent error when quisk starts up
There is one too many spaces (3 instead of 2) at the beginning of line 512.
def SetTuningLine(self, tune_tx, tune_rx):

At 96K/192K on UHFSDR + SDR-Widget severe stuttering so that signals are
not readable, OK at 48K.
CPU around 30%.
73 ... Sid.

362. Quisk 3.5.8

Yahoo group: n2adr-sdr
Date: 2011-10-29 10:25:31 UTC
From: Mario
Topic: 362 Message: 362

News from Jims page:

"
Quisk Version 3.5.8 October 2011
================================
The Windows version is now equal to the Linux version, and transmits properly.

I added a parameter agc_off_gain to the config file. It controls the audio gain
when AGC is off. Reduce it if sound with AGC off is too loud. Note that even with
AGC off, the output is limited to the clip level. I made some other improvements to AGC.

I added FM transmit. The modulation index can be set in your config file.

I made some improvements to demodulation, and to the SSB transmit filter. I fixed an
array out of bounds bug in transmit.
"

363. HiQSDR circuit problem.

Yahoo group: n2adr-sdr
Date: 2011-10-21 19:28:29 UTC
From: Sid Boyce
Topic: 351 Message: 363
Attachments: 1 described; binary payloads are missing from this source WARC

Devised a new circuit to speed up the relay switching.
When I press PTT in quisk /PTT only pulls down to ~+2.3V and is not steady - floating around that value.
The circuit functions OK testing with a static +2.4V battery simulating PTT and when the input pin is shorted to ground.

As far as I can tell the HiQSDR offers an open collector in series with a 100 ohm resistor and I am connecting it in series with 10K to +3.3V from pin 9 of N1.
Suggestions?
73 ... Sid.

Hi Sid,

i assume /PTT is X1 pin 6, right ?
This pin is the inverted state of the internal key_down signal.
This should really be low-active during TX. I do not know why this does not work for your board. Does the voltage also not go down if you just connect a pullup resistor ?
I am not really familar with Verilog but from the sources i do not see a reason why the pin shouldnt be able to drive low level.
Which one of the files you uploaded is your current PTT circuit ?

regards
Mario

From: Sid Boyce
Topic: 351 Message: 365

Correct, there is an amended file in my directory (HiQSDR_PTT.png) which shows Pin 6 /PTT, Pin 10 GND and Pin 9 is the +3.3V.
I have also tried R1=3.3K and R2=4.7K instead of 10K's.
Checked the continuity of the cable to pins 6 and 10 and +3.3V from Pin 9 is present.
Next I'll substitute a VN10KM/WM211 for the BS170 but I would expect the 10K or 3.3K pull-up to +3.3V would cause /PTT to go LOW.
73 ... Sid.

370. WSPR-HiQSDR TX success

Yahoo group: n2adr-sdr
Date: 2011-11-05 06:26:53 UTC
From: rv3apm1
Topic: 370 Message: 370

Hi to All

I had success with running HiQSDR on WSPR TX
used Windows 7 QUISK 3.5.8 WSPR software
connected Mic IN with Speaker out on my laptop sound card (FDX not good for this situation), for PTT use PTT button in QUISK
RX-TX switch antenna with Elad switch box.
The next tried Virtual audio cable VAC1-VAC2 with Full duplex FDX - also good.
Very useful button Scope - I see form output signal and keep it correct without limit!

Also did check output signal on my receiver - Perseus and it seems OK!
pictures TX in my folder - file section

Please watch my link - SWL report on the world 40 and 20m
50mW HiQSDR Delta DX-A
http://wsprnet.org/olddb?mode=html&band=40&limit=50&findcall=rv3apm&findreporter\

Hi Mario,

For receive (Ubuntu 11.10) - I connected Line(MIC) IN with Speaker- Line out
First running Decode Software like FLdigi
and later QIUSK
- all working here but no success on TX .... probably must more study
in Win 7 it work on RX-TX

Hi, all,

seems I'm well off with my hardware: The soundcard is an Intel ALC880 on-board soundcard (a number od in- and outputs, all kinds of jingles and bells) under Ubuntu_11.04. Configuring fldigi 3.21.8-3 for portaudio gets quisk's output directly to fldigi's input without any cables.

In addition to the usual ALSA stuff I have installed the Pulse Audio Sound Server 1:09.22 and libjack01:0.118+..., python-pyaudio 0.2.4-2 as well as libasound2-plugins 1:0-24.

I suppose I'm lucky that this works for me since I must admit that some of these modules were included automatically when installing a moin module.

However, no software (e.g. gmfsk oder flarq) that uses a /dev/dspX input will work in my setup and googling around quite a lot until now I did not find any remedy. All ideas welcome...

Are you using jack_connect or is it all happening because fldigi is
getting sound input automatically from the output stream?

379. DG7MGY photo labelled incorrectly

Yahoo group: n2adr-sdr
Date: 2011-11-13 02:52:57 UTC
From: Sid Boyce
Topic: 379 Message: 379

I was just going through the photos and I noticed the board looks
incorrectly labelled when checked against the circuit diagram.
The circuit diagram shows RN1 and RN2 going to X1 and the board layout
has pins 61 - 69 going to what is labelled X2 in the photo.

X1 is the top left connector and X2 is the top right connector according
to the circuit diagram.

I am using firmware 1.1.
I have been trying to get my RX/TX switch working with it connected to
the top left connector.

73 ... Sid.

Jerry,

Thank you so much!
Very useful and clear , did all in 15 minutes on Ubuntu 11.10 64 bit
and now can receive with pair Fldigi -HiQSDR and QRSS_VD-HiQSDR
all with pulse audio, no cables.
Not tried transmission - will do later.

73, Serge , RV3APM

Hi Serge,
When you get the transmission going, let me know and I'll add it to the instructions. I don't have an SDR TX yet so haven't tried it myself.

Not to my knowledge, seems to work automatically by hidden magic. I tried jack on several occasions but could never get it to cooperate with quisk - under Ubuntu 10.04 and ever after.. Right now the only components that show up as 'installed' in Synaptic are libjack0 and libjack-dev. Fldigi reports input when set to portaudio as its input source, that's all. No reverse frequency control from fldigi into quisk either.

Hi,

i can confirm that pulseaudio also works for me.
I tried this a while ago and had not much success. I think this was because i had the latency value too low. With latency at 200 i did not discover stoping audio anymore. I also tried with WSPR.
The TX side seems to work via pulseaudio as well since i saw a TX signal when using the full-duplex mode. I did not have a closer look.

regards
Mario

Hi Jerry

Seems all well - tried today TX with pulse QUISK3.5.9-WSPR3
my 50 mW received in Germany
No any special instructions - just always "pulse" - in-out and may be optimization level

Thanks
73 Serge

389. Are PCB source files available?

Yahoo group: n2adr-sdr
Date: 2011-11-23 04:09:22 UTC
From: cybinlabs
Topic: 389 Message: 389

Normally, there would be no special advantage in going to the agrivation of ordering a PCB from the source files but since Helmut is not responding to numerous queries about the purchase of a PCB and since I've already tied up hundreds of bucks for parts with the expectation of putting a board together I'm left with only two alternatives. Load up the source into the Target3000 editor discussed by Helmut at the technologie2000.com site and order a board, or take the time to do yet another layout starting from scratch.

Seems to me, in keeping with the spirit of Open Source, the PCB source should be made available if it isn't already. However, going into the files section I find "no joy".

If anyone has a better suggestion, I'm certainly interested. I really would prefer to just order a board by the first method even though a PCB-Pool/Target3000 - order has rough parity in price.

Hi,

i think Helmut already responded to your request, right ?

Hope you have success with getting your transceiver assembled and running. I have also still one PCB to be assembled.

regards
Mario

392. Control of HiQSDR/N2ADR

Yahoo group: n2adr-sdr
Date: 2011-12-16 09:02:40 UTC
From: Mario
Topic: 392 Message: 392

Hi,

i have put a pdf to the files section with which i started to document the control and the frame format of the HiQSDR frontend.
It is still far away from beeing complete and there are some questions but i think it is worth that someone with software experience looks to that and asks which information is missing.
I also started to do some test-implementation within Octave (Matlab clone) but only a few first steps are done there.
Hopefully in the end we have a description and a example implementation to show how to use the frontend.

regards
Mario

Hi Mario,

thanks to start this good work!
I reread your doc, seems like a perfect base for all software implementers, but also just for have a closer look into Quisk/HiQSDR!

btw: Preselector/Preamp/Driver board is coming to completion, i had a lot of QRL but now i have a litte bit time to complete the pcb artwork ;-)

73!

Helmut, DB1CC

A brilliant start Mario.
I downloaded it last night and read it about 2 hours ago. It set me thinking about hamlib support.

Thanks for the update Helmut.
I haven't got back to looking at my RX/TX switching problem.

If my memory serves me right I think N1 pin 6 on TX was 0V with no switching circuit connected when I initially powered up and poked around. The last measurement I made it was floating around +2V on TX. I'll go back and check it with pin 6 disconnected to see if it's a possible FPGA problem or my circuit is not allowing it to switch to 0V.
73 ... Sid.

Hi Mario and all others,

i'm quite new to this group. And it looks it's a very good timing. I joined to get some more information on how to control this transceiver - which i found here.

Your spec looks good. But there are still some questions:

* The control word has independent RXPhase and TXPhase. Are them useful independently? At the same time? Is full-duplex communication with different frequencies possible?

* Is TxLvl linear? What output power is achieved?

* Is Decimation = 1 usable - as it's not even? I'm interested in the highest possible bandwidth and there's no need to play to soundcard.
Is the information "960Khz bandwidth" at http://www.hiqsdr.org/ correct? My calculation gives a maximum of 384 kHz. I suppose the unit is wrong.

* The VNA functionality needs much more explanation. I suppose it's useful for higher frequencies much above 20 MHz.

* For the Transmission frame format there is no information about the samplerate. Is it only possible to transmit at 48 kHz? How much buffering is done in the FPGA? What is the behaviour if packets are not delivered "in time"?
May i deliver an IQ signal up to 192 or 384 kHz samplerate (=bandwidth for quadrature signals) for transmission?

* Is a DC frequency correctly modulated and transmitted? So it's possible to generate AM/FM and CW signals directly at complex base band?

thanks in advance,
and a Merry Christmas

kind regards,
Heyo

I have used 960K especially on 10m to see almost the complete band
activity so it works with no problems I could see.

I think the TX samplerate question is answered in either the QEX article
or on http://james.ahlstrom.name/transceiver/. It's 48K.

From: Guenter DL7LA
Topic: 392 Message: 399

dear all,

when in 'split' mode it is possible to transmit on the 'red' cursor while listening in FDX mode on the 'green' cursor. That works for me, just tried it in USB. Most probably the cursors must be in one window, you cannot listen e.g. on 80 and transmit on 20.

Please correct me in my following statements:

see above

>
> * Is TxLvl linear? What output power is achieved?

highly linear, internal IMD in two-tone-mode I measured >75 dBc on the DAC direct output of my homebrew board.
.
From Helmut's board I get around +17 dBm in CW.

>
> * Is Decimation = 1 usable - as it's not even? I'm interested in the highest possible bandwidth and there's no need to play to soundcard.

no, see Jim's remarks on the N2ADR website

> Is the information "960Khz bandwidth" at http://www.hiqsdr.org/ correct? My calculation gives a maximum of 384 kHz. I suppose the unit is wrong.

...well, 960 kSps works fine here ever since...

>
> * The VNA functionality needs much more explanation. I suppose it's useful for higher frequencies much above 20 MHz.

-can't comment on that right now

>
> * For the Transmission frame format there is no information about the samplerate. Is it only possible to transmit at 48 kHz? How much buffering is done in the FPGA? What is the behaviour if packets are not delivered "in time"?

you'll probably will have to decimate that before or change the software. The rates are essentially given by integer divisions of the main clock frequency.

> * Is a DC frequency correctly modulated and transmitted? So it's >possible to generate AM/FM and CW signals directly at complex base > band?

The output from the fast DAC is such that it produces a HF complex signal. Imagine it for the sake of simplicity as a DDS frequency where the carrier is phase and amplitude modulated at the same time so that its spectral components sum up to a SSB signal. If one wanted I and Q analog streams to modulate a RF carrier one would have to employ a 'sort of' a soundcard architecture concept, That would mean two D/A-Cs in the output chain.

From: Guenter DL7LA
Topic: 400 Message: 400

Dear all,

I would like to draw your attention to a very useful bit of programming done by Stefan,DL2STG called hiqscope. It offers a spectrum analysis for the complete range of the board, i.e. from nearly zero to 62 MHz, or in parts thereof. The nice thing is that his software runs in parallel to Jim's program (or standalone of course). You will get also time analysis and a long term waterfall (sample intervals from 10 ms to 1 hr). See Stefans website at http://dl2stg.de/stefan/hiqsdr/ The FPGA code has to be modified, since some more RAM space has to be created to buffer data. The C sources and makefile are available under/hiqscope, the other changes in /FPGA. I changed both my homebrew and Helmut's board without any problems.

Hi Guenter,

thanks for putting the spot on this... Great work !
Probably Stefan can give some comments on the changes that are done to the FPGA and to the way to use this functions.

regards
Mario

403. Re: Control of HiQSDR/N2ADR

Yahoo group: n2adr-sdr
Date: 2011-12-26 18:39:50 UTC
From: Mario
Topic: 392 Message: 403

Hi,

Rx and Tx frequency can be set independently and the frontend can be used in full duplex mode.
About TxLevel i have to check. The achieved output power depends on the output stage after the DA converter. The HiQSDR PCB from Helmut gives around 50mW output.
The highest achievable bandwith is 960kHz. Setting the decimation to 1 did not work when i tested it. I got too much frame losses because the 100MBit/s of the ethernet seem to be exceeded.
I was also not successfull to change the FPGA code for uneven rates. If more bandwidth is needed reducing the resolution (bigger changes in the FPGA) would be necessary i think.
Regarding the VNA functionality Jim asked me to remove this because it is not implemented yet and might be suspect to change.
TX format is 48kspl/s little endian, IQ.
Information from Jim that i will add:
" The function quisk_process_microphone() takes microphone
samples, filters them and creates a 16-bit I/Q modulated signal to send to the hardware. The function
transmit_udp() simply saves these until a whole block is available, and sends them to the UDP
socket. The data rate is fixed at 48000 samples per second."
As far as i have seen so far the AM signals look ok (carrier looks as expected). But i did not take a really close look to that so far. I have to test this with some test pattern and have a look with a measurement receiver. But i need to postpone that to january.
CW signals are generated in a different way. This is done in the frontend directly and you use the Key input for that. You may also generate CW in phone-mode by sending proper samples from the PC but this is currently not supported by Quisk.

regards
Mario

Hi,

thanks for your answers.

For the max. receive bandwidth it's my fault. The spec is absolutely correct. I was unable to read one of the 'zero's for the samplerate. At first glance it looked like the soundcard samplerate 192 kHz, but it is 1.920 kHz.

The fixed 48 kHz transmit rate is important to know. I hoped that more would be possible to use HiQSDR as an arbitrary wide-band wave generator :-(

thanks again,
Heyo

Hi Heyo,

no problem. I also had some calculation "problems" in the beginning ;)
Regarding the 48kspl/s for TX i understand that this might be a bit too slow for some applications but the design was done for CW and SSB and not for wideband digital modes. But anyway the FPGA design is open source and you may be able to change it to 192kspl/s which might be enougth for DRM+ or other stuff. Only problem could be memory and other resources of the FPGA.
Another problem i would point you to is the fixed IP address and the fixed MAC that can currently just be changed by modification of the FPGA Verilog code and rebuild of the FPGA image.

regards
Mario

Hi Mario,

only today (thanks to Winter vacation) I managed to read your
interesting document.
It seems quite feasible to write a server process in order to
integrate the HiQSDR Transceiver into gHPSDR3 software and/or an
especially crafted version of DSP server for that purpose.
Maybe Sid, that is involved in gHPSDR project and has an HiQSDR
Transceiver, could be interested.

Ciao

I'd be interested in any efforts.
I've tried building qsdr on Ubuntu 11.10 and openSUSE but the code needs updating for current distributions.

I tried Linrad via network but that didn't work but I'm thinking of gleaning bits from quisk to see how it communicates and how to convert it from python to C/C++ with help.

HiQSDR running ghpsdr3 would be a big plus, especially in terms of CPU requirements as quisk on an embedded platform like the Beagleboard XM isn't feasible.

Sid,
At the moment I have no budget for purchase an HiQSDR :-)
And, frankly speaking, I have plenty of SDRs here around, I have to sell something first.
Could you setup an host environment in order to develop a server process ?
In such case, I could try to do some remote development, using my QtRadio as GUI of your HiQSDR from
here. Let me know if you think this is a viable solution.

What are the prospects of adding a cypress fx processor? (Or using an ethernet chip that has a processor that can do more than load buffers)

It might drastically simplify things for a cpu to handle a full tcp/ip stack, dhcp, bonjour, etc. Bonus is that it could also be used to write a serial config rom from its usb port.

Hi Ed,

in general using a more intelligent solution for ethernet could be good. But i have no experience with that. Are there controllers that could do Gigabit Ethernet ? It could probably give some free space in the FPGA as well. But in the moment this is not too much in the focus i think. Helmut works on the Preselector currently and there is not too much other activity visible.
In the past there was a activity porting Jims original design to Kicad. I do not know whats the status there. Could be a starting point for some variants of the design.
Just need someone who has the time and the capability to do it ;)

regards
Mario

The only problem with speed via the 100MBps ethernet is really with
quisk which is written mainly in python and a Beagleboard XM I tried
does not have the capacity to run it, resulting a spurts of audio to the
point where any word is unintelligible.
Using a AMD XP3000+ laptop with IP Forwarding to another box on the LAN
and then to the LAN that the HiQSDR is connected to, no problem.
73 ... Sid.

414. HiQSDR Preselector / Driver

Yahoo group: n2adr-sdr
Date: 2011-12-28 16:03:44 UTC
From: Helmut Goebkes
Topic: 414 Message: 414

Hi Group,

i put the circuit diagram @ file area, in the directory structure DB1CC HiQSDR.

It takes a lot of time and many changed decisions of how to do preselection, driving, switching, but i think now we have a really good circuit. Anyway, please have a look to it an make your sugesstions, your pros & cons are really welcome!

Why takes it so long? - just a simple answer - i had a lot of work, private & QRL and i tried to make the Preselector / Driver as good as possible, so let me explain whats in the circuit and why:

Goal 1: development of a preselector / Driver board for HiQSDR
Goal 2: HiQSDR is not a cheap, quick & dirty project, so make
no compromise in technical specs ..

* Modular contruction allows simple change of filter modules
as well as simple and independant build, check / adjustment of
filters.

* currently, all filters are calculated & tested but the Modules
itself can hold nearly all possible filter contructs...
(also active ones)

* each amateur radio band gets a distinct, separate filter to
be selective as possible.

* Filters are designed to be "contest proof", so the band modules
are contructed to dampen the neighbor / harmonic bands

* Modular filters allow also future change in filter behaviour /
function modules, the module connector holds also switching signals
to route the signal and/or allows converters to set into the module
places.

* to be selective as possible, the filters are designed to be
symmetrical and can be used for RX as well as a prefilter
for TX/driver

* Preselector board hold all switching logic necessary for
RX/TX-switching inclusive PA power cycling. Swithing signals are
are available externally

* Optional, a 1 Watt broadband driver module can be plugged in, so
in combination with the antenna switching logic the
HiQSDR & Preselector/driver board results in a complete QRP
DDC/DUC Transceiver.

* To allow the use of all features of the HiQSDR, provisions are made
to use the full duplex mode as well (but unfortunally without
driver ;-))

* The module places are allows active converters
like LF/VLF Bandfilters / Converters or VHF Converters.

* solder jumpers @ modules allows selection of
driver / antenna routing or separate RX/TX connectors
selectively for each module.

* also via a solder jummper, the module can switch 12V
via a bias tee into the RX path to supply active
antennas. This power supply is current limited & protected.

* The optional driver module holds a broadband 1W-Driver, specially
designed to give a "good-as-possible" OIP3. This is the reason why
the decision is made to design it as push-pull structure.
with the curcuit given, -45dB OPI3 is possible to be a perfect driver
for biggers guns...

* Preselector is designed like the HiQSDR as 4-layer PCB to get best
possible rejection of unwanted signals and to allow a clean RF wireing
@ the PCB

* each module is separately shielded to his neighbor module @ PCB

* Active DC current injection is made into the RF path to prevent
the relays from the "fritter" effect (to be high resitive for small
signals)

Note: I designed the most of swithing with AXIOM HF3 RF-Relays.
The first development was made with HITTITE HMC284 for all switching purposes, but the
breadboard model shows that the many switches
tends to have too much loss (>3db in the signal path)
and diminish the IIP3.

Also the active switches introduces noise into the signal path, so
we decide to use the best solution: The HF3 from AXIOM, a
super but affordable RF relay. With an isolation of >85dB and insertion loss of less than
0.05dB this is the best solution. In production quantities the HF3 cost is around 2.5 US$

Ok, folks, thats all for the moment,
PCB artwork is nearly done, but is you see a big mistake or have sugesstions, please feel
free to comment the above!

73 and a good and lucky new year 2012 for all of you!

Helmut, DB1CC

Nice work Helmut,
Very impressive and all to the high standards of the HiQSDR.
That is a heck of a lot of work done by you to produce so comprehensive
a solution in the amount of time it took from ideas to product, even if
it had been a full-time job.

A Happy and Prosperous New Year!
73 ... Sid.

416. Preselector other observations.

Yahoo group: n2adr-sdr
Date: 2011-12-29 14:08:03 UTC
From: cybinlabs
Topic: 416 Message: 416

Thanks Helmut for your latest effort. Its always nice to read schematics with the opportunity to learn something new. I hope your getting enough sleep! I'm sure everyone is looking forward to adding the preselector to their shack as soon as it becomes available.

Several questions.

What program was used to plot/calculate the filter parameters? Looks like something I might like to use.

The output driver looks like it is intended for CW as it appears to run without any matching or feedback. Is this correct?

Any possibility of breaking the schematics up into multiple pages? It would sure make them easier to read.

The RF2420 is becoming somewhat of a rare part. Why RFMD stopped making it is incomprehensible. To bad really, I really like that part! Since you've obviously cherry picked the best of the best for the HiQSDR, what would be your second best alternative to the RF2420?

From: heyo_74
Topic: 417 Message: 417

Hello,

i had a deeper look into the tx measurements in the files section and got really surprised about imd results and especially the file 1M9_sin_overtones.png below DH5YM's folder / 7IY PCB.

i would not expect any overtones in an FPGA design at least up to half the samplerate of the DA converter. any explanation?

regards,
heyo

Topic: 417 Message: 418

Hi Heyo,

i never optimized the drive of the MMIC i use with my PCB.
Most probably the poor harmonic behavior is caused by the amplifier.
I will do the my measurements again with the PCB from Helmut.
It should be much better there.
In the latest version of Quisk Jim improved some TX filtering. So probably also the intermodulation data changes.
I did not do much experiments with the transmitter path so far.

regards
Mario

> In the past there was a activity porting Jims original design to Kicad. I do not know whats the status there. Could be a starting point for some variants of the design.
See my files area:
http://groups.yahoo.com/group/n2adr-sdr/files/OH6EH/

As for using a separate controller, that's what Jim tried in the first
version (exciter) and discarded it. I find the current implementation
very simple and therefore elegant. 1 Gbit/s interface would be nice
but they tend to be all designed for PCI...

Cheers,

Hello Guys,

I have read the original article and I can follow most of it but there's something I don't understand about down-conversion.

I had assumed that by sampling the RF input at above the Nyquist frequency of the HF bands it would be possible to dispense with the external band pass filters that are necessary to prevent aliasing in analogue mixer designs and that low-pass or band-pass filtering would be an integral part of the down-conversion and decimation performed in the FPGA.

I note that the pre-selector design seems to include band-pass filters and so I deduce that this function is not performed by the FPGA, perhaps it is beyond the capability of this FPGA?

I would be grateful if someone could clarify this for me.

Regards

Chris Stake

Hi Sid,

Pin 6 is the \TXACTIVE Signal and is a 3.3V CMOS compatible
Signal.
It should be LOW (<0.4V) if TX is active (PTT pressed)
and >3V if TX is not active (PTT / KEY not pressed)
You can connect a low current LED with a current
limiting resistor in series to 3.3V to have a TX-ON lamp)
If it shows the opposite sibehaviour or levels are
the chance are great the the PIN of the FPGA is defective
;-(

greetings and a happy new year!

Hi all,

I just pushed into master branch the experimental code in order to support the HiQSDR transceiver.

For the sdr-widget people, the web site is

http://www.hiqsdr.org/

instead the ghpsdr3-alex site is:

http://napan.ca/ghpsdr3/

The code specific for Hiqsdr has been written by me, IW0HDV; many thanks to Sid Boyce G3VBV for the
invaluable support: he provided his radio, a powerful Linux PC and Internet connection for the
development.
Many thanks too to Mario Roessler DH5YM that wrote a precious document (found at
http://hiqsdr.finken-net.de/FPGA-N2ADR/n2adr_control_doc.pdf)
that explains the details of the network protocol used to control
and send/receive data to/from HiQSDR hardware.

Many thanks agian Andrea.
I've just cloned master to try later today when I get back home.

Please feel free to access any time.

Later after installing the master branch and putting it on the server
list I'll have to take it down to check out the RX/TX switching problem.
It used to work but changeover was about 3 seconds so I built a new
circuit which switches from High to ~2.3V floating level rather that to
/PTT of 0V, probably due to a mis-wire.

Glad to be of some small assistance in getting another rig added to ghpsdr3.

It's been working solidly on the LAN for almost 48 hours.

It would nice as the next move to be able to get the full 960K spectrum
working as it does in quisk, but that's not a near term goal.
73 ... Sid.

Trying a fresh clone of ghpsdr3-alex. Built and installed the master branch.
hiqsdr-server launched.

dspserver gets
ozy_init: connect failed: Connection refused

I see there is a configure option for Perseus but not for hiqsdr.

I restarted the processes from a clone I did yesterday evening after the push in GIT, and
it is working.

Hi,

i have now ready the GNU Radio extension for HiQSDR. You are be able to use the transceiver now directly as input or output device in GNU Radio. All files and some examples are on:

http://dl2stg.de/stefan/hiqsdr/gnuradio.html

From: Helmut Goebkes
Topic: 438 Message: 438

Hi Group,

today i installed QTRadio running under Windows
after connecting to G3VBV running HiQSDR i can operate
the HiQSDR in GB from my home shack in southern Germany
without problems! I checked against a station received
directly with my TS-2000 the audio delay was around 500mS -
QTRadio is very impressive! - thanks to the folks who
implemented HiQSDR to this nice Software base and
thanks to all who are working active on this Project!

I think many HiQSDRs are accessible via the net soon... ;-))

73! Helmut, DB1CC

440. TX LED

Yahoo group: n2adr-sdr
Date: 2012-01-10 09:26:27 UTC
From: Mario
Topic: 440 Message: 440

Hi,

i remembered that someone reported problems with the TX-LED signal.
Today i noticed that i do not see that it is controlled in the current quisk 3.5.11. At least the only thing that is different when i press TX in quisk is the software-TX bit. The bit for the LED in the byte that controls X1 is not changed.
I will try again with my piece of octave code. Probably someone can verify that independently.

regards
Mario

From: Sid Boyce
Topic: 440 Message: 441

My RX/TX switch is using X1 pin 6 and it's not switching. I wonder if
that problem wasn't introduced in an earlier version where I didn't try TX.

When I click on PTT, X1 pin 6 floats at ~2.3V, earlier it went to 0V
with I think earlier than quisk-3.5.6.
Going back to 3.5.6 it now crashes out when PTT is pressed.
73 ... Sid.

Hi Sid,

i tried with my Octave code to set the TX pin and there was no reaction. Other pins on X1 can be set properly. I already asked the question to Jim and probably i find some minutes to have a look to the FPGA code. Either some misunderstanding on my side or it really does not work in the FPGA code. Lets see. I will try with 3.5.6 too and compare with the current behavior.

regards
Mario

Topic: 440 Message: 443

Hi Mario,
I'm sure it worked after the antenna switching hardware mod. I checked
it would switch between Antenna 1 and Antenna 2 and also that RX/TX worked.

I was having a problem with the original RX/TX circuit taking ~3 seconds
to switch the relays on and off.

The day I built the new RX/TX switch, the original stopped working and I
built the new one with same results.
I didn't keep track of any quisk upgrades as I didn't suspect quisk at
the time.

Are you seeing a floating voltage (~2.3V) on X1 pin 6 when you press PTT?
73 ... Sid.

444. Re: TX LED - behaviour & levels of PIN 6, Connector X1

Yahoo group: n2adr-sdr
Date: 2012-01-10 20:30:11 UTC
From: Helmut Goebkes
Topic: 440 Message: 444

HiSid, Hi Mario,

i tested X1 Pin6 TXLED (low active!) Signal, all is working correct,
also with version QUISK 3.5.11
(FPGA Firmware 1.1 with Stefans extension)

During receiption, this Pin must be >3V (3.28V in my sample),
if you switch to transmission, this pin must be <0.4V
(0.01V in my sample)
The interface connector X1, Pin6 is working correctly via Software PTT-button as well as via Hardware PTT / Key activations, even with the newest Quisk Version 3.5.11.
This switching is done immediatlely @ this pin, with no noticable delay (!)

I checked this with 3 different HiQSDR Boards, all shows equally this correct behaviour like the described above.

Maybe you stumbled over the mode dependant PTT switching:

For CW the Hardware input "KEY" switches to transmission but
all other modes (SSB,AM,FM have to use the hardware "PTT"-Input.
BUT (!) the Software-Button "PTT" on Quisk
switches ALWAYS the TX on and therefore the PIN 6 of X1 has to
switch every time to low (aka <0.4V) if you press the
"PTT"-Button in Quisk.

If your Pin6/X1 has other levels than <0.4V for TX active
and >3V for RX active, is assume that the Pin if the FPGA
is defective.
You can try to reprogram the FPGA, maybe it works then,
otherwise this I/O-Pin is gone into silicon heaven ;-(

73!
Helmut, DB1CC

Hi Helmut,

thanks for all the explanation.
You were perfectly right. In my Octave script i made a copy&paste of a mistake that i made within Quisk. I used CW mode ;)
In addition i understood something wrong. I thought that i can set the TX-LED pin via register access via the X1 byte. Actually it seems just controlled by the FPGA itself (indirectly by setting the software key bit in non-CW modes). I would have had seen this earlier if i had read back the replies from the frontend. But i did not ;)
The signals are working fine here now and i will update the API documentation accordingly next days.

regards
Mario

I disconnected the RX/TX switch and I'm seeing no voltage on X1 pin 6. I checked the plug and cable for continuity.
With a thin piece of wire in the socket pin 6 only shows +0.13V on RX, also on pin 9 +3.3V is absent.
I'm using a thin length of wire that goes firmly into the socket which should be making contact as I can see the flared contact easily.

I am getting +3.3V at C20 so there is more checking to be done.
73 ... Sid.

Seems the wire was not making contact, checking pin 9 on the cable it's
+3.3V, pin6 is still not not showing a voltage.
I'll build another cable tomorrow.

448. API documentation

Yahoo group: n2adr-sdr
Date: 2012-01-11 10:40:20 UTC
From: Mario
Topic: 448 Message: 448

Hi,

i added some details on the X1 control byte and the attenuator control.
I also uploaded my test scripts that i use to verify what i write down.
They are pretty straight forward but probably useful for understanding.
Please report questions (and also spelling and grammar mistakes).

The API stuff has moved to a subfolder of my privat folder in the files section.

regards
Mario

449. Extensions for HiQSDR

Yahoo group: n2adr-sdr
Date: 2012-01-11 10:44:51 UTC
From: stefan.goerg
Topic: 449 Message: 449

Hi,

for receiving higher frequencies as 6m, i tried to use my old MVT-7100 scanner. I have the scanner expanded with a IF-output and HiQSDR now receives the IF with 45.1 MHz. It is nice to see the complete 70cm range with hiqscope, transformed to 40-50 MHz.

Better solution would be a real transverter, the best is a universal hardware interface to expand the rx and tx range up to 2 GHz or higher. A nice solution a have found is the concept of daughterboards for USRP: http://en.wikipedia.org/wiki/Universal_Software_Radio_Peripheral . Knows someone a universal hardware like the WBX, 50 MHz□2.2 GHz Transceiver, usable with HiQSDR ?

Another idea is to use a sheevaplug (http://www.plugcomputer.org/development-kits/plug-computer-basic.html) to create a transceiver usable without a computer. I mean, the sheevaplug should be have enough computing power to do the dsp-operations and - expanded with a simple audio usb stick □ to do all modulation and demodulation. The size of sheevaplug is only 10*7 cm, should good fitting in a case. Completed with keys, controls, display and helmuts new preselector, it may be a nice device.

Topic: 449 Message: 450

Hi Stefan,

my opinion is that a good transverter should be used with the HiQSDR to achieve a excellent performance.
For simply operating on VHF and UHF you may also consider the Miniverter stuff from W1GHZ.
http://www.w1ghz.org/

Regarding small PC:
the sheevaplug seems a nice device and there is also a small touchscreen monitor with USB connection for that one.
Other choice might be to use a tablet with enough CPU power but i do not know if there is one with ethernet interface.
My own solution for the moment is a I7-2600 PC in a small PC enclosure. For portable usage i would prefer a remote connection from a laptop to prevent taking a monitor with me.

regards
Mario

451. Re: ghpsdr3-alex: server for HiQSDR

Yahoo group: n2adr-sdr
Date: 2012-01-13 07:53:00 UTC
From: Mario
Topic: 427 Message: 451

Hi,

i also now got the server for HiQSDR compiled and running. I had problems with QT4 on my SDR PC but it worked pretty fine with a Ubuntu driven laptop.
Unfortunately i have no antenna that would make it worth to share the SDR with you. I just have a mobile indoor antenna and sometimes i mount a vertical to the balcony. But it cant stay there.

I noticed that the version of QTRadio installed from the PPA archive does not work anymore. I always get connection refused or disconnected. The version i compiled myself works pretty fine. Is there a special reason for that ?

Another question: I understood Codec2 is used to transfer audio from the DSPServer to the QtRadio client. Is there any possiblity to get samples with reasonable quality to another software e.g. DREAM for DRM decoding ? For this QtRadio would also need 12kHz and 21kHz SSB Modes. At the moment 5kHz is the maximum bandwidth.

I assume QtRadio does not handle TX with the HiQSDR yet, does it ?
How would be the handling of CW signals ? (evaluation of the TX indication in the RX signal, i think i have to write it down rather short term ;))

At the moment also 192kSpl/s is the maximum adjustable rate from the frontend. Is this a current restriction of ghpsdr ?
Anyway it works rather nice. Quisk has some advantages over QtRadio and QtRadio has some advantages as well.

Thank you very much !

regards
Mario

Topic: 427 Message: 452

Hi Mario,
Early days yet for the whole project and earlier still for full HiQSDR support.

Alex Lee saw ghpsdr3 as a great vehicle for extending support to Softrock and add-ons like the SDR-Widget which which is capable of 192K max.

The base code by John Melton supported HPSDR (96K max), so support for mainly Softrock and later Perseus has been the work of Alex (9V1AL), Andrea (IW0HDV) and others.

Andrea volunteered to do HiQSDR support less than 2 weeks ago using my setup remotely as he only has HPSDR and Perseus.

I have a problem with TX which is a hardware problem so it's not been possible for Andrea or myself to test TX, it's an unknown at present. The /PTT +3.3V on my HiQSDR is missing so some more work has to be done to track it down. I was able to TX using quisk before this problem occurred.

Andrea informs me that changes to a number of files would be needed for >192K support.

Your HiQSDR documentation has been of great benefit in adding support.

The code is still in a state of constant flux and is being expanded at quite a pace.
73 ... Sid.

Please report every bug or problem you get, we can try to solve it.
Report the distro and the whole configure/make output showing the
error. We need the broadest case history possible.

> I noticed that the version of QTRadio installed from the PPA archive does not work anymore. I always get connection refused or disconnected. The version i compiled myself works pretty fine. Is there a special reason for that ?

Yes , you are right; the PPA ghpsdr3-exp is compiled from the master
branch that is lagging behind.
However we are doing test in order to produce a new master. Maybe in
the next weekend I could be able to refresh the PPA.
Note that there is another PPA with the rxtx but this too is not so recent.

> At the moment also 192kSpl/s is the maximum adjustable rate from the frontend. Is this a current restriction of ghpsdr ?
> Anyway it works rather nice. Quisk has some advantages over QtRadio and QtRadio has some advantages as well.

Really it depends from two points: one in QtRadio, that is already
been removed, but not yet in master branch, and another one in
dspserver that I removed for early support of Perseus and that we have
to reintroduce (essentially a rate conversion on audio backend).

454. TX screenshots from HiQSDR PCB

Yahoo group: n2adr-sdr
Date: 2012-01-15 13:58:36 UTC
From: Mario
Topic: 454 Message: 454

Hi,

i added a ZIP file with some screenshots i took from my HiQSDR PCB to the files section.
Looks pretty well i think. Just in CW mode there are some spurs that should not be there (but with very low level).
Some effects that i saw with my original N2ADR PCB are not there. So the signal looks much better with the work from Helmut.
Probably also some recent improvements in Quisk have some contribution. I used 3.5.11.
On 50MHz a significant degradation of the noise performance is visible.
The harmonics of the 80m testsignal are visible here as well. So this seems to be generated in the FPGA already i assume.

regards
Mario, DH5YM

Chris:

This question is best answered by considering the question: What would you see if you sampled a non Nyquist filtered square wave at say 350 MHz with the HiQSDR operating at its normal conversion frequency?

All the various harmonics that are manufactured by the non linearities of the amplifiers, mixers, and samplers that are fundamental to their operation show up in the pass band of "Nyquist filtered" signal. Pre filtering conserves the dynamic range of the receiving system by allowing only the signals of interest to be processed.

There has been some previous discussion on the merits of 14 vs 16 bit A/D conversion. When using digital filters, especially FIR filters, it takes a huge number, some times hundreds, of taps to reach the out of band specification. When IIR filters are used, the availability of more bits will help to improve stability of the digital filter when narrow band filters are deployed. Round off noise is also improved. One should never rely on a "magical Nyquist filter" as it to is only an approximation to the ideal.

You might try reading the Verilog code and see if you can figure out what the pass band response looks like.

Hi Sid,

Where to download QTRadio?

73,
Dale

Thanks for the report Helmut,
It's an amazing project that's still young and a nice fit for the HiQSDR.
Thanks also for your contribution on the hardware and looking forward soon to the addition of the pre-selector board.
73 ... Sid.

On 09/01/12 19:04, Helmut Goebkes wrote:

Hi Group,

today i installed QTRadio running under Windows
after connecting to G3VBV running HiQSDR i can operate
the HiQSDR in GB from my home shack in southern Germany
without problems! I checked against a station received
directly with my TS-2000 the audio delay was around 500mS -
QTRadio is very impressive! - thanks to the folks who
implemented HiQSDR to this nice Software base and
thanks to all who are working active on this Project!

I think many HiQSDRs are accessible via the net soon... ;-))

Hi Dale,

please find the QtRadio project Wiki here:
http://napan.ca/ghpsdr3/index.php/QtRadio_Installation
All necessary steps are described there.

regards
Mario

458. qsdr-0.9.3 build problem

Yahoo group: n2adr-sdr
Date: 2012-01-20 11:57:24 UTC
From: Sid Boyce
Topic: 458 Message: 458

```
gnuradio-3.4.2 configure script
-----------------------------------------------
#!/bin/bash
./configure --prefix=/usr --with-boost-libdir=/usr/lib --disable-volk
--enable-gr-audio --disable-gr-cvsd-vocoder --disable-gr-gsm-fr-vocoder
--disable-gr-trellis --enable-gruel
-----------------------------------------------------------------------------------------------
---------------------------------------
I applied the patch to gnuradio-3.4.2, built and installed it with gruel
configured.
Did qmake-qt4 then make.

Hi,

is a correct libgruel-3.4.2.so.0 in /usr/lib ? I think, there is a incomplete installation of gnuradio in /usr.

73 Stefan

461. Re: ghpsdr3-alex: server for HiQSDR

Yahoo group: n2adr-sdr
Date: 2012-01-21 10:21:49 UTC
From: Hubert
Topic: 427 Message: 461

Hello Andrea IW0HDV,
the last few days i tested ghpsdr-alex from git with the rxtx-rtp-symm and my HiQSDR.
System: Debian 64Bit, Gnome, Alsa and Pulseaudio, ghpsdr-alex git from 19. January 2012

I have found few things here:
QtRadio runs but no Sound to the Speaker, sometimes on startup
i hear for a very short time signals.
jmonitor runs well. Probably sound of QtRadio

If i end first the dspserver and second the hiqsdr-server with q enter the hiqsdr do not switch back and send network packages to the net. On a new startup i have to switch off the HiQSDR bevor a new startup of hiqsdr-server and dspserver.

Here are the Messages from QtRadio:

Hi Hubert,

that ill behaviour seems unrelated to hiqsdr-server because jmonitor is working.
If you have Internet at disposal try first to setup QtRadio alone, using one of several server
available (press key 'L' for the list).
In any case, it is advisable to select pulse in the Receiver->Configure->Audio and leave the RTP
checkbox without tick in order to use the socket option to vehiculate audio/spectrum.
Next, if the defect persists, open pavucontrol and check if the volumes are ok.

Probably you discovered a bug: I have to check it with Sid's hardware though.
Alas at the moment I don't have anymore root/sudo rights on Sid's machine and I cannot check with
tcpdump what is doing. Maybe Sid can check for that.

Just looking to the code it seems that I missed the final deinit call.
So, if you want to experiment a little bit more, please add, into the module
trunk/src/server.ccp
the following line

```
hiqsdr_deinit ();
```

just before the last

```
return 0;
```

compile it with make and retry.
Ciao

Hello Andrea IW0HDV,
thanks for your quick replay.
First i have take your hiqsdr_deinit (); to the code of server.ccp
now it is all ok. In every condition the hiqsdr run and stop.
I've even closed the server intentionally false, fitted with a restart everything again.

Now i will take QtRadio, i will made some screenshots from QtRadio
and take it here to the Photos section of DG7MGY.

My QtRadio rxtx Linux Audio Settings:
Device: alsa_output.pci-0000_05_00.0.analog-stereo
Sample Rate: 8000
Channels: 1
Encoding: aLaw
Byte Order: LittleEndian
Use RTP: No

With ghpsdr-alex - QtRadio Version master Nov 24 2011 without rxtxbranch all ok.

With Windows QtRadio i have no Problems to connect the Linux dspserver and control HiQSDR
with the signals.

Debug Message of QtRadio rxtx:
Debug: command: "startAudioStream 800 8000 1"
Debug: Connection READ ANSWER
ans length = 36
Debug: Connection READ ANSWER
ans length = 15
Debug: Waterfall::updateWaterfall 985 (985), 149
Warning: Got a buffer underflow!

look like a problem with audio stream?

Ok, thanks to to try; I will push the change to GitHub repository.

> look like a problem with audio stream?

Mmm, I think think it is a local issue; because I test several release of QtRadio, try to delete
the QtRadio configuration file and restart it.
From your trace it seems that QtRadio is selecting the wrong device.
Another thing to check are the volumes of different channels with alsamixer.

If you install TeamViewer, I can connect from remote and try to understand what is going wrong with
your audio.

Hello Andrea IW0HDV,
yes it is a local problem between stream/qtradio and soundsystem.

I have deleted the configuration, that was one of the first things that i have done. Same as before, also i have checked the alsamixer.

One thing i have changes my alsa-base.conf like this:
Load sounddriver options sorted by Huber
options First XFi Titanium, Second CTX935 DVB-T, Third USB-Audio (FA-Interface,Logitech Cam)
options snd-ctxfi id=XFi index=0
options saa7134-alsa model=auto index=1
options snd-usb-audio index=2,3 vid=0x08bb,0x046d pid=0x2902,0x08d9

My sound modules from lsmod:
lsmod | grep snd
snd_ctxfi 82660 4
snd_pcm_oss 41081 0
snd_mixer_oss 17916 1 snd_pcm_oss
snd_pcm 63744 4 snd_ctxfi,snd_pcm_oss
snd_seq_midi 12848 0
snd_rawmidi 23060 1 snd_seq_midi
snd_seq_midi_event 13316 1 snd_seq_midi
snd_seq 45093 2 snd_seq_midi,snd_seq_midi_event
snd_timer 22917 2 snd_pcm,snd_seq
snd_seq_device 13176 3 snd_seq_midi,snd_rawmidi,snd_seq
snd 52798 14
snd_ctxfi,snd_pcm_oss,snd_mixer_oss,snd_pcm,snd_rawmidi,snd_seq,snd_timer,snd_seq_device
soundcore 13065 1 snd
snd_page_alloc 13003 2 snd_ctxfi,snd_pcm

I have take som Pictures to my Photo Directory.
Now i will work to teamviewer, or du you have an x2go-client?

I had it playing on the LAN using RTP for about 20 minutes after
building and installing, then it fell silent.
Made the change below, recompiled and started hiqsdr-server and dspserver.

Qt Radio is still silent.

I had the same happen yesterday after I rebuilt everything and ran
QtRadio from a different box on the LAN to the one I used this time.

As usual it's fine on my Android phone and I dear say for others
accessing it over the internet.
73 ... Sid.

No luck by removing the config file.
It's a local issue though I can't figure why it happened suddenly on
openSUSE, Kubuntu and Ubuntu.

I think I shall try master, then rxtx-event to see if that makes a
difference.

470. FPGA V. 1.2

Yahoo group: n2adr-sdr
Date: 2012-01-22 10:14:49 UTC
From: Mario
Topic: 470 Message: 470

Hi all,

Jim informed me that he released FPGA version 1.2:

"...
A new firmware version 1.2 is now available. This version includes support for wider transmission bandwidths up to 22 kHz for wider FM and for DRM. There
is also a new "Qs" command that returns the hardware status as the same string used by the "St" command. There is no need to upgrade unless you need to
transmit FM, or you wish to query the hardware with the "Qs" command (for example by Hamlib).
..."

And as far i understood he also added a network analyzer function.
I will have a look and add this to the API document. But it may take some days.

regards
Mario

472. HiQSDR Preselector Board PCB

Yahoo group: n2adr-sdr
Date: 2012-01-25 15:06:38 UTC
From: Helmut Goebkes
Topic: 472 Message: 472

Hi Group,

i uploaded the actual PCB Artwork of the HiQSDR Preselector / Driver board into the file area (HiQSDR, Preselector).
The circuit diagram has changed also to reflect the wishes and technical request from several group users.
Following mayor changes are made (and a lot of minor ones):

The Driver 1W-PA module is pin/function compatible to the widely used
1W-module from DL2EWN, availalbe from FUNKAMATEUR magazine.
Additionally, (i had some space on the board free ;-)
i spent this space for a 10W-PA-Module which is coming soon for the
board. This 10W-Linear Broadband PA can be installed instead
the 1W-Module (not additionally!).
To fit the thermal needs of this 10W-Module, a thermal heatsink can be mounted to the chassis thru the board.
All control electronics & power switching is contained to supply the 1W or 10W-PA module and to connect it directly to a antenna.
A aditional connector holds the signals from the 10W-PA
(Forward power, return power, ALC, Power control Signals)
for external display / control board or external High-Power PA

Preselektor board is fully supplied from 12V DC.

Optional, a low-noise switching regulator for 6.5V, 1Amp can be
placed on the Board to supply the HiQSDR-board. This Option has to be checked not to inject noise into the signal path- this checks can only be made with the prototype PCB in a few days..

All signals coming from FPGA (HiQSDR) are buffered & filtered.
Also filterd all signals going out from Presel-board.

the Board is made from a 4-Layer Multilayer Board, same Quality as HiSDR. Prototype board is ordered and avised wthin 10 days...

I keep you informed!

73!
Helmut, DB1CC

Hi Sid,

> Will the Preselector be offered as a built-up unit?
> 73 ... Sid.

Yes , i will offer the Preselector same wasy as HiQSDR, as PCB alone,
as Part Kit and as complete built and tested because many OMs are not able or willing ;-)
to solder many 0603 SMT parts.

The only drawback are the lot of core coils which have to be built,
currently i did not find a professional manufacturer for the coils -
but i am looking for one who is willing to wind all the coils for us ;-)
The BP-Modules are sold separately so every one can decide what he needs.

btw Sid, thank you and Andrea for your super work with QTRadio!
I uses this beautiful Software last week every day (on your site mostly!) - this is a
perfect fit for HiQSDR!
If you need any information or hardware to test, pls feel free to reqrequest for them!
Also Stefan had done a super work for our community with his super HiScope and interfacing
GNUradio - the game has just begun... ;-)

476. Quisk 3.5.11 filter mods

Yahoo group: n2adr-sdr
Date: 2012-01-25 20:40:49 UTC
From: wb4jfi
Topic: 476 Message: 476

I just uploaded the quisk.py and quisk default config py files that I modified to add the demod bandpass filter shadow.

I have a little less confidence in these than the past, it seems that Jim did some work nearby one of my changes. If someone that is interested could test them out, I would appreciate it. I only check my mods with a Charleston SDR Receiver each time, as I keep that hardware hooked up to the Linux box that I use to make mods.

There is also a text file describing the changes (as usual).
tnx & 73s

From: Sid Boyce
Topic: 472 Message: 477

Thanks helmut,
The Preselector is quite a large project and hope you find a
manufacturer for the coils. Otherwise a part kit with builders winding
their own is one way to go.

Perhaps what spurred Andrea on was the fact that he owns HPSDR and
Perseus and with the information in quisk and Mario's document it seemed
HiQSDR support was easily possible.
73 ... Sid.

478. HiQSDR universal bandfilter module

Yahoo group: n2adr-sdr
Date: 2012-01-27 08:48:28 UTC
From: Helmut Goebkes
Topic: 478 Message: 478

Hi Group,

i added the circuit & PCB artwork for the universal Bandfilter module
for HiQSDR Preselector to the file area.
The circuit is designed for universal use, that means that we can realise many different filters with several poles on this module.
This keeps the cost low and allows easy modification or
new filter designs easily.
To be flexible and allow fine adjustment to keep tolerances low,
all capacitors are layouted twice. With this we can built capacitors with unusual value by paralleling two.
The minimum electronics is contained on top to select RF routing via
solder bridges and to show the active selectionof module with a LED.

the exact values and positions of parts for all Bands are published in a few days after verification with the prototypes.

best regards & 73

Helmut, DB1CC

479. HiQSDR for DRM TX

Yahoo group: n2adr-sdr
Date: 2012-02-04 10:36:32 UTC
From: Mario
Topic: 479 Message: 479

Hi all,

some minutes ago i managed to use the HiQSDR frontend for DRM TX.
I followed DL2STG's guideline for installing Gnuradio and adopted his dual-tone TX test example to transmit a baseband IQ DRM file.
There was just a small IQ swap ;)
The 64QAM MSC constellation diagram looked really clean so far.
I tried ModeA 10kHz bandwith. 20kHz should work as well but i did not try yet.

regards
Mario

480. FPGA Version 1.3

Yahoo group: n2adr-sdr
Date: 2012-02-07 06:45:49 UTC
From: Mario
Topic: 480 Message: 480

Hi all,

Jim is also further working on the FPGA. He released a new version 1.3:

"...
A new firmware version 1.3 is now available. This version fixes a problem with spectrum flatness when sampling at 960 ksps, and adds the special features used by the Quisk VNA program. The VNA program "quisk_vna.py" enables the hardware to be used as a vector network analyzer, and it requires this firmware or above.
..."

As far as i understood quisk_vna.py is not completely finished yet but will be updated soon.

regards
Mario

482. Re: problem with Quisk on Windows-7

Yahoo group: n2adr-sdr
Date: 2012-02-10 19:44:41 UTC
From: Mario
Topic: 481 Message: 482

Hi Ken,

i assume you are running Quisk under Windows ?
Do you use Win7 or XP ?
I did not try Quisk under Win for a while. In general you should use the quisk_conf_sdriq.py from the quisk base directory and copy it to your user home directory. Then you need to rename it quisk_conf.py.
As alternative you might start quisk from a shell with "quisk -c quisk_conf_sdriq.py". And do not forget to check the content of the configuration file. Probably you need to make changes regarding soundcard and usb interface. I have no clue how to tell Quisk the correct USB port under windows.
In quisk_conf_win.py there are the following hints:
If you use an SDR-IQ for capture, first install the SpectraView software
that came with the SDR-IQ. This will install the USB driver. Then set these parameters:
import quisk_hardware_sdriq as quisk_hardware # Use different hardware file
use_sdriq = 1 # Capture device is the SDR-IQ
sdriq_name = "SDR-IQ" # Name of the SDR-IQ device to open
sdriq_clock = 66666667.0 # actual sample rate (66666667 nominal)
sdriq_decimation = 500 # Must be 360, 500, 600, or 1250
sample_rate = int(float(sdriq_clock) / sdriq_decimation + 0.5) # Don't change this
name_of_sound_capt = "" # We do not capture from the soundcard
playback_rate = 48000 # Radio sound play rate, default 48000
display_fraction = 0.85 # The edges of the full bandwidth are not valid

Hope that helps so far. I fear most of the people here do not have a SDRIQ because its a bit focused on the FPGA based frontend from Jim.

regards
Mario

I haven't been very impressed in SDR-IQ, it is basically a black-box
commercial design offering not much to learn about SDR. Being
developed around an obsoleted chip without any way to improve and
develop, it is a gadget for a wealthy appliance amateur, certainly not
for an experimenter.

> The President of RFSpace, Pieter Ibeling N4IP, has posted some

Which are? Come on, you must be joking...

Is this a some sort of 'cleverly' hidden commercial or what? Get real!
I find the open hardware and software described by N2ADR way more
interesting and educating that anything RF Space have ever produced.
And it is FREE to LEARN!

Cheers,
Kaj OH6EH

Kaj:
For the money, the SDR-IQ is a pretty good device. Granted that it uses a 14-bit A/D, and uses a dedicated DDC chip (AD6620), so it's not the front-runner for SDR hardware. But, for the money (less than half QS1R, much cheaper than Ozy/Merury/etc), it does a nice job. Yes, you don't need to burn your fingers to get it running, but that is always an option with ANY hardware, based on your competence.

BTW, the N2ADR SDR hardware is also only an 14-bit A/D. There are definately advantages to the N2ADR board over the SDR-IQ, but at what cost?

James must have had an SDR-IQ at one point, as he has had SDR-IQ support built into Quisk for several versions back. If it's been good enough for him, I'm OK with it.

I used my SDR-IQ with Quisk (both Linux AND Windows versions) to help me write the Quisk drivers for the Charleston SDR Receiver. Was that not learning about SDRs?

These days, the hardware is often just the price of admission to joining the SDR SOFTWARE generation. Having a decent black box that you can rely on as a "test bench" for software is a very handy part of the development process.

I have SoftRocks, SDR-IQ, Ozy/Mercury/Penelope/Atlas, Flex-1500, Flex SDR1000, Charleston Receiver, SDR-Cube, SDR-Widget, SDR2GO, and am collecting parts to build the Gerd N2ADR SDR board. Plus, an Elecraft K3, Icom IC-720, PCR-1000, PCR-100, and RX320. These all have advantages and disadvantages. I do NOT use only one of them.

Have you actually used an SDR-IQ, or just looked at the specs to develop your dismissal?

I find that the N2ADR hardware costs significantly more than the SDR-IQ, and is difficult for the average amateur to build, if you want to follow that option. Yet, I am not quick to dismiss it, in fact it is my next big project.

And NO, this is NOT a commercial for ANY manufacturer (as you can see from the above list). Some of us actually use several of these devices, can compare them, and not slight or dismiss any of them out of hand. Sorry. And, I DID get real!

To each his/her own.

There is also a update for the HiQScope-FPGA extension:
http://dl2stg.de/stefan/hiqsdr/files/fpga_ver3-sg1.1.tgz.

Please use only this version, the older one has a little bug and makes a delay before the vna work.

I updated yesterday, so far only tested RX with qsdr and remote
operation from my Android phone using aHPSDR to connect to dspserver
-->hiqsdr-server of the ghpsdr3-alex project.

Hi Jim, Stefan, Sid, Group,

i updated the Firmware of all HiQSDR on stock to deliver
the HiQSDR with actual FW to users.
Works all very fine and without problems!
Thanks again to all active members of the group!
Jims VNA Proggi works fine too and shows the
tremendous possibilities of the N2ADR / HiQSDR concept!

Some days before i jumped very deep into Linux- a hard work for me
as experienced Windows freak ;-) I get my eyes wide open to see how perfect linux works
nowadays - not the pure geek tool as i remembered
it as i tested Linux years ago. Only "Unity" in my opinion is a step backwards.
I am frankly to say that i am up to changing my main interest to Linux.....(it's better to
jump into the arms of a penguin than
out from a open window... (giggle))

As a startup i installed (with the help of Hubi, DG7MGY) QTRadio
and it works with all servers from the first time on with HiQSDR.
Currently i set up a small system (Zotac ITX-MB, 2 x 1.8GHz Intel Core, 4GB Ram, 60MB SSD)
with Ubuntu 11.10 and QTRadio servers to place
this with an attached HiQSDR (and probably Preselector/PA) to WWW.

This setup qwill be available as remote station with QTRadio clients.

Installing GNUradio fails due to missing libry items, but
Hubi (DG7MGY)is lurking the reason for that....

btw: Preselector Boards & Filter Modules arrived some days before,
(4-Layer PCB, goldplated, looks verrry nice...)
Currently i am building the protoypes. @ Weekend i make photos and place them in the group
file area.

73!
Helmut, DB1CC

Thanks for the update Helmut.
Updated to fpga_ver3 a few days ago.

I have one problem with ghpsdr3-alex that's not a HiQSDR problem. I just cannot get sound from any server using QtRadio from the master or rxtx-rtp-symm branch. The problem seemed to start with either the rxtx-symm or rxtx-rtp-symm branches so I'm backtracking to try and pin it down.

Yesterday I went back to the rxtx-event branch and that QtRadio works fine. Master branch hiqsdr-server/dspserver and rxtx-event branch QtRadio combination currently working.
73 ... Sid.

Hi Sid,

I tried you accessible hiQSDRseveral times, it works most the time without problems. I am sure that - with your experience - you will solve the problems with sound.

what is the symm branch? Is this the "unified" alex file branch??

It is the recently unified branch but in QtRadio it shows up as
rxtx-rtp-symm.
I shall use "git bisect" and hopefully find out where exactly the
problem code was introduced.

Hello Sid,
i have the same problem too with audio and QtRadio.
I have take out all my Soundcards, reinstalled alsa and pulseaudio...
No success, i have installed the same ghpsdr3-alex code from git on Helmut's Ubuntu system and all works well.

The difference between Helmuts and my system are Helmut use Ubuntu 32bit and my system was debian 64bit.
My opinion the 64bit soundsystem of pulseaudio was buggy.

Sid do you use also a 64bit system ?
I have writen with Andrea IW0HDV and he would check his QtRadio code.

Resume if you want to run the newest hamradio software use a 32bit system. ;-(

I saw the suggestion that 32-bit runs OK and it may be a 64-bit problem.

Sound works OK for an other application including non-SDR.
For SDR quisk, qsdr, fldigi, Linrad, etc., etc. all work.

Everything was working fine on openSUSE, Ubuntu and Kubuntu, all 64-bit
with 1 Ubuntu 12.04 box, 2 Kubuntu 11.10 boxes and 2 openSUSE 12.2
Milestone 1 boxes up to some way into the introduction of rxtx-rtp-symm
when all of them gave no audio output at the same time.

It would seem there is a problem in the code that doesn't affect 32-bit,
just a question of finding the commit that caused it. It may be a long
search but it has to be found.
I wish I had paid more attention to it then as it would have been easy
to identify the bad commit.
73 ... Sid.

Then came

Hi all,

for better understanding a vector network analyser i try to write a software for it. The results (screenshots, src(linux,win) and a win32-setup) and you find at:
http://dl2stg.de/stefan/hiqsdr/qvna.html

I hope it is usefull for someone. Version 0.9.1 is translatable for windows and has some bugfixes (sometime invalid sync for small sample values).

Very impressive! I think this helps also others to understand VNA
better, thanks to the sources!

Somehow I haven't found your site before, a lot of interesting stuff there.

In fact, I have been thinking whether there would be enough LE and RAM
left in the FPGA to implement a scope-like app also. Now I know :-).

Off-topic: is there a way (in Quartus) to see the amount of LE:s
allocated by an individual module (the total is of course in the final
report)?

Cheers,
Kaj OH6EH

502. quisk patches for a more Pythonic C API

Yahoo group: n2adr-sdr
Date: 2012-02-22 06:23:14 UTC
From: A. Maitland Bottoms
Topic: 502 Message: 502
Attachments: 3 described; binary payloads are missing from this source WARC

Hi,

I've been using quisk for a while, and recently decided to make
Debian packages of it. The current distribution method is a little
fragile and likes to stay where it's compiled.

So I looked into the docs for Python C API extension modules.[1]
That seemed to do the trick. What I got working takes care of
Python versions 2.5.x-2.7.x using the PyCObject method. Naturally
that doesn't work for Python 3.x which uses Capsules[2].
Is anyone using quisk with Python3.x?

I've got a set of three patches[3]:
quisk_c_api - main module exports symbols
sdriq_c_api - client module uses CObjects
charleston_c_api - client module uses CObjects

I've tested all this code and it works fine. But I'm
open to comments and suggestions, and I hope that
this can be rolled into the main quisk source.

73 de aa4hs,
-Maitland

Hi,

many thanks for your work !

Did you already submit your patches to Jim N2ADR ? He does not currently read this list.
Therefore he needs to get the patches via eMail.

regards
Mario

504. Re: ghpsdr3-alex: server for HiQSDR: attenuator and antenna selector

Yahoo group: n2adr-sdr
Date: 2012-02-27 23:31:57 UTC
From: Andrea Montefusco
Topic: 427 Message: 504

Hi all,

I just pushed into iw0hdv branch some code in order to manage attenuator and antenna selection.
Many thanks, as usual, to Sid Boyce G3VBV that supports the development providing radio, PC and
Internet connection.

Please test it throughly: in fact during my tests I discovered a strangeness.
Whilst the attenuator has a very quick answer (switching it from 0 dB to -40 dB, the signals drop is
immediately visible on the spectrum) when I switch the antenna input from #1 back to #0, the signals
remain low: after maybe 20/30 secs everything is back as usual.
I guess Sid doesn't have any real antenna on secondary input #1 but the delay sounds strange.

73 iw0hdv

I only have antenna #1 attached.

Checking with quisk-3.5.12 the attenuator works as it should.

When I clicked on antenna #2 signal stopped and the relay changeover was audible but when I went back to antenna #1 signal did not come back in ~15 seconds.

Restarted quisk and it took about 15 seconds before it burst into life on both spectrum and sound.

On antenna changeover this time it took 23 seconds before normal sound level was restored, spectrum unaffected.

Third try spectrum and sound restored in 5 seconds when back on antenna #1. Relay operates immediately on selection.
73 ... Sid.

Same with antenna changeover with qsdr, both spectrum and sound came up
after ~20 seconds.
73 ... Sid.

Sid,
many thanks for testing with different software: more or less you had
the same results that me with ghpsdr3-alex.
It seems that some capacitor in the signal path is charging or
something similar, but maybe the hardware guys here can explain us
what we are missing (if any).
Could you try to put a 50 ohm termination on the antenna #2 and test
it again (with one only sw is enough) ?

   am

That's worth a try.
As the relay transfers instantly I'd expect signal straight off.

It used to with the FPGA v1.1 firmware and now its programmed with 1.3-sg1.
Perhaps the other guys can test and report if they have the same problem.
73 ... Sid.

The 1.3 is the 1.1 with additions for use with hiqscope and VNA.
I have only had brief look with hiqscope and with VNA I had a look at
the impedance and VSWR of my Quad, seems a very good tool for checking
filters etc. and is quite easy to use.
73 ... Sid.

Hi,

this morning i tried with the iw0hdv branch of ghpsdr and the antenna switching works fine at my side. No delay except the audio coder delay.

Sid, how does antenna switching behave with your board if you use Quisk ?

Do you use the 1.3-sg1 or 1.3-sg1.1 ?
(FPGA-1.3-sg1.1 (Bugfix for Version FPGA-1.3-sg1))

Stefan reported a bug that caused delayed output of his scope functionality. But probably the effect you notice is related to that somehow. Anyway i am also still using the 1.3-sg1 and here it is working fine.

regards
Mario, DH5YM

In the previous message on this thread Sid already reported the
results of his tests with Quisk:

>> When I clicked on antenna #2 signal stopped and the relay changeover was audible but when I went back to antenna #1 signal did not come back in ~15 seconds.
>> Restarted quisk and it took about 15 seconds before it burst into life on both spectrum and sound.

Hi Mario,
Exactly the same using QtRadio from Andrea's branch of ghpsdr3-alex,
quisk-3.5.12 and qsdr.
73 ... Sid.

Hi Sid,

thanks for the input. Did you do the modification exchanging the BCR148W to BSS138 ?
http://hiqsdr.finken-net.de/html/modific.htm

I remember you had one of the very first boards, right ?
Could be the BCR148W assembled.

regards
Mario

I did the mods on 18th. October last year and it worked fine with v1.1
which was installed in August.
I never checked again with v1.2.
73 ... Sid.

Hi Sid,

thats very unusual behavior of the board, indeed.
I just can't play around with different designs for the FPGA because i do not have the altera programmer here.
I can just imagine that it has something todo with the supply voltage.
Cannot imagine that someone changed settings of the output buffer at the FPGA.
I will ask your question in the german speaking group.

regards
Mario

Topic: 427 Message: 517

Hi Sid, Mario & group,

i checked antenna relay & attenuator behaviour on all HiQSDR
reachable from here (8 pcs) and all working ok & without problems.
The delay between antenna switching & audio output is
less than 100mS (processing delay) and therefore normal.
Sid has (had) same problems with his external "TX_ACTIVE" signal
that switches only after some seconds delay.
I tried to simulate this behavior several times but i never can find this.
In in my opinion the FPGA is not correct programmed
or defektive @ this outputs due to external signal injection.

Fact is, that two Specs must be correct: Input Voltage to HiQSDR maust by >6.5V preferrable
7VDC to produce correct level of stabilized 5 V to drive the relay & circuit.
The relay switching transistor must be a
low voltage FET type like BSS138W. otherwise the relay MAY audible
switch but sometimes the relay makes not correct contact.

External connections to FPGA are sensitive 3.3V-Level signals!
NEVER try to connevt these signal to a source that injects more than
3.3V into the FPGA! The protection resitors are no absolute guarantee
not to damage the FPGA! Best ist only connects HCT-ICs to the outputs
and drive FPGA Inpputs only from 3.3V-Supplied LVS-Chips or via resistive dividers!
The Preselector does it this way and works without problems @ external
connections.

Best regards!

Helmut, DB1CC

@Sid: if you send me your HiQSDR, i will check & repair it for you.

Thanks Helmut.
I thought we were aiming for close to 6.0V and I have 6.03V.
I shall wind it up to 7.0V later and recheck.
73 ... Sid.

Now at +6.98V, no change.
It appears it's changed over successfully and signals are at a very low level for up to half a minute and it then jumps to the proper level.

With the stronger signals on the band this evening I have been able to hear what's happening. It's as though there is a high resistance contact for the period.
73 ... Sid.

Hi Sid,

Hmmm... very strange behaviour.
maybe the relay is defective, i had this with another one,
but this was only one of several hundreds i used over the years...

73!
Helmut, DB1CC

That's what I'm thinking also.
Another thing I have to check is the /PTT signal which seemed to be floating, checked out the cable so far so need to meter at X1.
73 ... Sid.

Thanks

Very nice
Tested with QVNA my PA3AKE BPF - seems work OK
picture in my photos section
But not sure about correct calibration procedure

523. Preselector Board Prototype running

Yahoo group: n2adr-sdr
Date: 2012-03-04 19:45:49 UTC
From: Helmut Goebkes
Topic: 523 Message: 523

Hi Group,

today i finished testing of the prototype board of the HiQSDR-Preselector board, all running as expected.
Some minor PCB changes will be done this week and than we start shortly production of Board & Filter modules.
I added some photos of the prototype connected to HiQSDR directly via adapters (shure, cables are also possible ;-) to the files area.
Also i include measuring of the 40m BP Module on HP Network analyser as example.

I keep you informed!

73!
Helmut, DB1CC

Hi,

for calibrating S21 (Transmission) connect TX and RX and use "Calibrate through". If you change the attentuator, calibrate again. For S11 (Reflection) use a directional coupler and calibrate open, match and short.

Recalibrate all
connect TX and RX and use "Calibrate through" used RX attenuator in QVNA 20dB TX=0
Now better BW lost 2 dB in QVNA , minVNA 1.1 dB
Spectrum out of bands on HiQSDR-QVNA better than miniVNA , I not see harmonics.
So good I think
Thanks, 73
Serge

Topic: 531 Message: 532

Hi Dale,

Sounds like you have a connection issue. Did you already check if all signals arriving at the EPCS16 ?
For active serial mode the FPGA should not even be in the loop.
If the EEPROM cannot be programmed there must be something wrong with the communication lines or the EEPROM itself (or its power supply).

regards
Mario

I started with 11.0 and I installed 11.1 when it came out, that's when I had a problem with it not seeing the Programmer.
I don't know if the BAT64-05's are needed but I think they must be there to offer protection against over voltage.

536. How do I test one?

Yahoo group: n2adr-sdr
Date: 2012-03-20 04:32:08 UTC
From: mathisono
Topic: 536 Message: 536

Hello! All

Im interested in FPGA based SDRs. Ive done a basic design of a similar styled SDR. I would like to study a this design. Im really interested in getting one of these going.(BUY) I would all so like to discuss some other possible ADC and DAC like the MAX5879 & ADC12D1800. Chips like this could make for a really wide band SDR, that would operate in the ghz. Combining the DSP_CPU or FPGA and an operating system CPU, could make a low powered self contained Ultra wide-band SDR with a QT Gui and knobs for a mobile SDR.

Mathison

Hi Mathison,

Welcome to the group!

Shure there is room for improvements, but you have to deal with some
limits as well! Even if the parts are really available (both are not..) the price and
needed bandwidth set the limit.
3 GHz ADC/DAC needs FPGAs with similar thruput - ok they are available
but not payable ;-(
The ADC12D1800 has 12 Bit resolution, but a ENOB of just 9 Bits,
really not really impressive for our goals.
Do not forget that noise is also related to bandwidth and you have to deal with this
bandwidth also @ preprocessing/filtering and board layout. Last but not least for what to
heck do you really need
DC to 3 GHz in one chunk? Practically wou need always a frequency selective part before (!)
the ADC - not to get too overdrive your
(ENOB 9 low resolution) ADC. So you also can use converters/transverters before the DDC/DUC
to do that
frequency (pre)selection.

Also the accompanied PC needs the power and bandwidth to process
the signals - and what do you really gain from a DDC/DUC Transceiver
with a working window of - lets say 48 KHz - out of 3 GHz ??
The stability needs for modulations like PSK31 / WSJT set another limit too.

Shure, ignoring all before, such a DDC/DUC can be realized.
You are invited to develop & built it! The estimated cost of such a development can easily
go to the higher $$$$ area, the production price too....

DDC/DUC types like N2ADR/HiQSDR are - in my opinion
(others may think different..) the best way to practical usable digital transceivers - but
not for every price.

If you want to go to higher frequencies it is no problem to use transverters and use the
DDC/DUC then as "Baseband" DDC/DUC.

Best regards!
Helmut, DB1CC

Alias bands with undersampling is often also a good way to go, maybe
tuned circuits in the preamp might be in fact enough to do the
filtering.

Stability is set by the FPGA clock that can be locked to a stable
reference which should be very easy.. FPGA PLL's should not be used
for sample timings because they are very noisy.

> DDC/DUC types like N2ADR/HiQSDR are - in my opinion

Yes, I agree totally. In fact there are some very interesting
low-priced devboards that might be usable, porting N2ADR firmware (or
part of it) might be an interesting exercise :-).

> If you want to go to higher frequencies it is no problem to use

Or using ADC/DAC analog bandwith to full and undersampling (alias responses).

539. /PTT signal

Yahoo group: n2adr-sdr
Date: 2012-03-20 13:46:35 UTC
From: Sid Boyce
Topic: 539 Message: 539

Had a good look today at N1 pinouts for the 1.3-sg1 firmware and
comparing it with Jim's write up on quisk 3.5.5 and later.

N1 pin6 used to be the pin and /PTT worked, perhaps that was for the
original firmware and when I upgraded to v1.1 I didn't notice or
overlooked the pin change.

I'd like confirmation that it's now N1 pin 7 (FPGA pin 57).
73 ... Sid.

Hi Sid,

> original firmware and when I upgraded to v1.1 I didn't notice or
> overlooked the pin change.

No Sid, the pin assignment is not changed! All delivered HiQSDR
are the same layout (V2.4t)
If you can measure a signal @ Pin7 maybe you have a shortage between Pin 6 / Pin 7 ?

Pin 7 ist connected to FPGA Pin56 and reserved for future use.

please see for references: www.hiqsdr.de

X1: Preselector connection
Micromatch PIN FPGA PIN Description
PIN 1 69 Band switch D0
PIN 2 68 Band switch D1
PIN 3 65 Band switch D2
PIN 4 64 Band switch D3
PIN 5 63 High=PreAmp_ON
PIN 6 57 Low=TX_ACTIVE/TX_LED
PIN 7 56 CCTX (reserved for later use)
PIN 8 55 CCRX (reserved for later use)
PIN 9 +3.3V
PIN 10 GND

For your reference, i added a screen dump of the part around X1 & FPGA into the files area
named HiQSDR_X1_FPGA.JPG

73!

To gain resolution with undersampling requires even more stringent filtering, and filter loss will eat into gains in ENOB. Some of that filtering will possibly need to be between a buffer amp and the ADC to reduce the wideband noise out of the buffer.

256x oversampling would gain you 4 bits if done correctly, and save you one mixer stage on a downconverter.

Trying to come up with a 10-15 mhz wide filter for a 2.3 or 3.4 ghz ham band receiver that was reasonably low loss and reasonably flat would be challenging with steep skirts. The overall result wouldn't outperform a 100mhz 14 bit adc with a single conversion, and with the quality filter required, it wouldn't be frequency agile.

Put differently, what would you use it for where the signal levels would be high enough and require that much bandwidth?

Without better adc parts, what do you hope to accomplish?

Thanks Helmut.
I'm measuring 3.3V on pin 7 and 0V on pin 6.
quisk is showing firmware version 1.3.

I used to get 3.3V on X1 pin 6, now that's at 0V permanently with the background of PTT in quisk showing red when activated.

I'll check RN1 at pins 6 and 3 to see what I am getting out of the FPGA and across RN1.

Hm, you need antialias filter in any case.

Yes but how to do that (direct sampling) economically at 2.3 GHz (or
even in my case at 800 MHz)?

> Trying to come up with a 10-15 mhz wide filter for a 2.3 or 3.4 ghz ham
> band receiver that was reasonably low loss and reasonably flat would be

The filter bandwidth needed for utilizing alias responses is of course
a factor of the ADC sampling rate.

As an example, you could use an ADC with sampling rate of 200 MHz
which is doable with the FPGA in question and they are available at
reasonable prices. Then you'd need to have a filter BW around 70 - 80
MHz which is doable at 800 MHz (10%). I agree that most ADC's have
analog bandwidth less than 1 GHz, so that is the hard limit for using
aliases. OTOH a transverter IF at e.g. around 600 MHz would make image
filtering very easy in the transverter for even at microwaves.

> 100mhz 14 bit adc with a single conversion, and with the quality filter
> required, it wouldn't be frequency agile.
Well, I am certainly talking about >= 14 bit ADC's > 100 Msamples/s.

> Put differently, what would you use it for where the signal levels would
> be high enough and require that much bandwidth?

> Without better adc parts, what do you hope to accomplish?
Simplicity and low phase noise. One FPGA with 200/150 MHz ADC and
reasonable filters would give coverage of 0 - 800 MHz without any
PLL's. Doing that with a 2 Gsample/s 14 bit ADC would be quite a
task... Further, you could design transverters so that their LO is a
multiple of the sampling rate...:-).

Cheers,
Kaj OH6EH

The filter needs to be approximately Fs/2*oversampling multiple if you want to oversample and eliminate both noise and aliases. without increasing the ENOB, the performance on low level signals is about 50 years behind the times when using <12 bits. You can some improvement with gain ahead of adc, but then you give up dynamic range

If you had a 400 or 500 msps 16 bit part that gave 14 ENOB, and used it on say the 70 cm ham band, that would be very interesting.

It would let one sample nearly 8 mhz contiguous specturm with 17 ENOB (about 102 db dynamic range). It would be feasible to build a helical filter or saw filter bank that was switchable through entire ham band that would be well matched to 64x oversampling.

546. More on Quisk and Fldigi working together

Yahoo group: n2adr-sdr
Date: 2012-03-28 17:03:05 UTC
From: jimahlstrom
Topic: 546 Message: 546

Hello everyone,

I am currently working on making Quisk work nicely with Fldigi. I got receive working by using the excellent instructions by Jerry, KA6HLD. But sending transmit audio from Fldigi to Quisk was a problem.

I saw solutions based on JACK and Alsa snd-aloop, but none using PulseAudio. Has anyone gotten this to work?

I have a solution of sorts. I created a PulseAudio null sink device. I send Fldigi transmit audio to the null sink, and attach the Quisk microphone to the monitor of the null sink. In PulseAudio every sink, even a null sink, has a monitor output. This works, but it is cumbersome to create the null sink. Is there a better way? If not, I can describe this method in detail.

I am also working on frequency and PTT control between Quisk and Fldigi. I have a working model based on the XML-RPC built into Fldigi.

Hi Jim,

nice to hear from you here.
Regarding the audio and Pulse i cannot really comment. I have no experience with that. For connecting between Quisk and DREAM DRM decoder i use the alsa loopback device but this is not very suitable for all operation were you want to listen in between.
What would be helpfull would be a possibility to disconnect the audio output of quisk from the speakers of the PC for just listening to the output that is done by another software (e.g. DREAM).

regarding control of Quisk out of Fldigi probably Stefan DL2STG can comment. He has implemented some control of his QSDR software. I think i remeber he uses the hamlib stuff. Probably there is something genereric inside hamlib that you may use for Quisk as well.

regards
Mario

I agree! after I used Google to translate the page. I had sticker shock!

Would it be possible license the production of a batch here in California, that could go out to American buyers? A club might like Califroina QRP might be interested in that?

Like wise the The American Pacific conference for Radio is going to be a national event for Americans. That takes place here in California later this year http://www.pacificon.org/ what are peoples thoughts?

Hey Terry, Terry here! (WB4JFI)

I'm building one of Helmut's boards. I have almost all the parts now. Helmut's board is first-class, it appears to have gold plating instead of normal. I believe his board layout his better as far as noise around the A/D, but he also has the voltage regulators mounted on the board, which adds heat. For that reason, he has designed a heat sink that fits under the board.

In building up his board, I must say that one cannot collect the parts and board, and build it for much cheaper than his finished boards. I would have done that if I had all the funds available at once. Instead, this has been a five-month (or longer) process for me.

I am using a spreadsheet to track parts costs, but there are a few places where I messed up and put in more parts than are actually needed. I typically buy spares of most items, and several parts for common-values, and I need to scrub my spreadsheet of those.

I purchased most parts from Digikey or Mouser, which also raised the cost a little. Buying some parts from Jameco, or other sources might reduce those costs.

The rare parts for me included:
1. The PC board itself. Purchased from Helmut.
2. The RF2420 attenuator chip. I also purchased from Helmut.
3. The Avago CPL-224-500E optoisolator. Not a good replacemetn found from US suppliers yet. Package size is a major issue.
4. Protec GBLC03C transient protectors. I used a substitute recommended on the HPSDR group for Hermes.
5. Power connector. I will work around this.
6. Heat sink. I plan to buy from Helmut.

Many of the other part numbers Helmut used were not directly available in the US, but subs can be found.

If it would help, I could probably put a cleaned-up version of my parts tracking spreadsheet here in the next day or two. It shows part numbers, vendor selected, and pricing. Some pricing is not correct, as I often bought ten or fifty items, even if I only needed one or two for the actual build. I have a committment tonight, taking up the time.

Again, once you look at the total parts count and cost, you might be able to save $100 or so over buying Helmut's fully built board. HAving him build and test the unit is probably worth that premium. Group purchasing of parts would help, but many of the savings would be in the small-cost items, so a LOT more trouble for little value gained - in my opinion.

There are other board designs out there, but I've seen occassional comments about the noisier front-ends.

Typing fast, so ignore the typos, please....
Terry, WB4JFI

Topic: 556 Message: 556

Hello group members,

i added some files for the description and circuit
of a precision RF Bridge to use the N2ADR/HiQSDR as
a full featured VNA.
Jim, N2ADR programmed the outstanding feature to
use the HiQSDR as VNA. With this feature you can
measure in thru-mode filters, amplifiers a.s.o
and in reflective mode antennas, impedances and
impedance matchings and much more.
To use the thru-mode, you have to use just a
attenuator in the range of 12..25dB not to overdrive
the HiQSDR RX input, the device under test (DUT) located
in between TX-output and RX-input.
To use the reflection mode, you must additionally
use a directional device like a directional
coupler or (better) a resistive RF bridge.

All fles you will find in the files area:
Files > DB1CC HiQSdr > HiQSDR RF Measuring bridge >
Measurements with HiQ RF Bridge

The RF bridge is nothing new - the principle is well known
for many years and features wide bandwidth, very good
directional properties (>42dB from 1MHz to 1GHz in this case)
and sinple construction. BUT: it is not usable with power.
To measure impedances, VSWR, antenna matching or
behaviour of antennas properties or other devices, power is not needed, so the first choice
is here a precise resistive bridge.
The operation frequency ranges from approx. 1MHz flat and wide
up in the GHz range with a directional factor of >40dB.

Only the coupling to the meauring RX (speak the hiQSDR RX)
is a little challenge. The diagonal of the RF bridge is symmetric
and this symmetry must under no circumstances de disturbed
to be precise. On the other hand, the RX input of the HiQSDR is a asymmetric 50Ohm coaxial
input.
To convert from symmetric to asymmetric, a balun can be used.
To guarantee a flat frequency response over the wide range
from 1 MHz to more than a GHz, special care has to be taken.
The used balun is a ferrite loaded coaxial balun, well known for years too and often used
as mantle current blocking device in
antenna systems.

To ease the building of the RF Bridge, i made a small PCB
wich is divided in two parts: the bridge part wich holds

the resistive bridge and three SMA-connectors for reference Port
(50Ohm Load) the RF input and the connection to the device under test.
the second part holds a connector to HiQSDR RX
and a attenuator to protect the RX input.
Both PCB parts are soldered into a shielding case, the
ferrite loaded coaxial balun and its compensation line
(a seconds coaxial cable wich has onla the shield used)
are soldered between these two pcb parts.
Over the two coaxial cables, 22 ferrite pig nose-type double
hole ferrites are placed.

In a separate directory i copied the measuremens i made of my
SteppIR-3-Element with HiQSDR as VNA and the HiQ-RF-Bridge
as directive element.

PCBs, Parts, Kits or complete built RF Bridges are available
soon via the known places for HiQSDR.

Best regards & 73!
Helmut, DB1CC

557. Re: More on Quisk and Fldigi working together

Yahoo group: n2adr-sdr
Date: 2012-04-20 14:06:17 UTC
From: jimahlstrom
Topic: 546 Message: 557

Hello,

I have a new Quisk version 3.6.1 with the new interface to Fldigi. It supports both transmit and receive, as well as frequency setting and PTT. I am using XML-RPC for rig control. I recommend the ALSA loopback device to transfer audio, but you can use any other scheme of your choice. I would be happy for any feedback and suggestions for improvement.

Hi Prasad,

the boards are offered by Helmut, DB1CC.
You may find purchase information at http://www.technologie2000.de/page5.php
Have a look to the end of the page.
Most difficult thing could be to get it through the indian customs ;)

regards
Mario

560. Helmut: problem sending you email

Yahoo group: n2adr-sdr
Date: 2012-04-23 06:21:30 UTC
From: wb4jfi
Topic: 560 Message: 560

Sorry to others for the bandwidth here.

Helmut, I tried to send you an email, but it was returned to me by your email provider. According to the return mesage, my ISP (knology.net) is blacklisted, it was sent by the mail system at host amavis-outgoing1.knology.net. I can provide more info if needed.

I was checking to make sure you received my Paypal from 4/17.
Thanks.
Terry, WB4JFI

564. HiQSDR Parts list

Yahoo group: n2adr-sdr
Date: 2012-04-29 04:15:17 UTC
From: wb4jfi
Topic: 564 Message: 564

I lost track of this, but I finally remembered to post my spreadsheet of parts sources and pricing for my HiQSDR board build. It is based on Helmut's excellent spreadsheet, and I added info to the right on my parts sourcing. It is in the file section, under WB4JFI.

For many of the parts (esp. caps & resistors) you need to order more than you will need just to make minimums. I other places, I ordered extras of common values for future projects.

I have NOT actually build my board yet, so beware, there may be an issue to two here. I plan to build mine in a few weeks, once I get a block of time to focus on it. I did my best to purchase similar parts to Helmut's build wherever I could.

In the long run, if you can afford to, I still recommend that you go ahead and buy Helmut's board. It will come already built and tested. This is especially true if you do not have access to an Altera FPGA programmer (or equivalent), which you will need to program the FPGA code into the flash/eeprom. I happen to have one from working on the openHPSDR (and oher) stuff.

I provided two versions of the file, one in Excel 2010, and the other in Open Office format.
Enjoy.
Terry, WB4JFI

565. New Quisk version 3.6.2

Yahoo group: n2adr-sdr
Date: 2012-05-22 17:12:57 UTC
From: jimahlstrom
Topic: 565 Message: 565

Please go to my http://james.ahlstrom.name/quisk page to download the latest version of Quisk. It is no longer available on pypi.python.org.

I added a display of the filter bandwidth to the graph screen. This is based on code provided by Terry Fox, WB4JFI. Thanks Terry! See the file quisk_conf_defaults.py.

I added detailed information on each sound device to the config screen. The Test button now generates AM and FM as well as CW and SSB.

The receive filtering has been re-written to improve the shape of the filters and to reduce the CPU time. Quisk now runs on my fan-less Shuttle Atom machine at speeds up to 480 ksps. The CW filters are particularly nice.

Jim

567. Helmut: never received heatsink and IC

Yahoo group: n2adr-sdr
Date: 2012-05-24 04:59:20 UTC
From: wb4jfi
Topic: 567 Message: 567

First of all, I apologize to Helmut and the group for the bandwidth. For some reason, apparently I cannot get emails through to Helmut, because of ISP issues. I've tried several times.

Helmut:
It's been about a month since I last heard about my order for one HiQSDR heatsink and one or two Avago optocouplers, they still have not arrived. Were they sent in a way that can be tracked? I did not pay for insurance, so I know it's not insured. I didn't think that I would need to for a simple piece of metal, and two small ICs... oh well.

Regarding my email problem: here is the body of the email I just received, which is typical of the undeliverable email message. I removed your email address and the host's IP address.

This is the mail system at host amavis-outgoing2.knology.net.

I'm sorry to have to inform you that your message could not
be delivered to one or more recipients. It's attached below.

For further assistance, please send mail to <postmaster>

If you do so, please include this problem report. You can
delete your own text from the attached returned message.

The mail system

<helmut's email address>: host mailin.goracer.de[ip address removed] refused to
talk to me: 553 sorry, your IP 24.214.64.231 is blacklisted in
ix.dnsbl.manitu.net, please contact the maintainer of that blacklist to get
delisted

The email problem has been there for the last couple of months.

Any help that you can provide would be appreciated.
thanks & 73
Terry, WB4JFI

568. Missing hiqsdr_swig.cc in gr-hiqsdr gnuradio muild

From: cybinlabs
Topic: 568 Message: 568

I've just successfully loaded/installed from source gnuradio in Ubuntu 12.04, gnuradio companion comes up magically, ... looking very good.

loaded the gnu radio patch to hook up hiqsdr to gr from DL2STG but running make I get
..
.
g++: error: ./hiqsdr_swig.cc: No such file or directory
g++: fatal error: no input files
compilation terminated.

I don't find hiqsdr_swig.cc anywhere in the directories

So close... so far away..

Please advise

Thanks

Chuck

From: wb4jfi
Topic: 567 Message: 570

Just to make this VERY clear, this was not meant to slight Helmut in any way.

Less that 12 hours later, Helmut has contacted me with how the package was sent, and has tried to find out what happened from his end. I can now check with my post office, and start looking for it from this end as well.

Helmut is great! He made a generous offer to take care of it right away, which I don't want him to lose money on.

My problem, which caused me to use the Yahoo group, was that I simply could not contact Helmut. I have two different sets of email addresses, using two ISPs. I was getting emails kickbacked on all of them. Apparently, they are blacklisted, and the email system Helmut uses will not change that status.

So, I still highly recommend the HiQSDR and Helmut. He is very responsive, and willing to help out right away. I suggest that getting insurance is, well, cheap insurance!

(Helmut: I sent a reply to your email, it will be interesting to see if you get it)

Sorry for the bandwidth.

Hi Sid,

yes address is correct, but you should add an additional line containing "GERMANY"
otherwise it is possible that the package
is landing on mars...

Sid,

Thanks for leaving it up for my demo!

No problem Rob,
Doing that with your demo in mind.

Guys, Rob is doing a talk late Friday and wants to demonstrate
ghpsdr3-alex, it would be nice to have a few more HiQSDR's available if
only to show there is more than one up and working - it could generate
wider interest.
73 ... Sid.

Cool work!!!

Looks like there have been a few difficulty getting the units delivered in the US. I wish it was just simple to order a unit with options instead of sorting thou specialty part kits. I Sprechen Sie Deutsch bitte. I can afford one as a student, at the moment but My UC Berkeley Radio club has been asking me what SDR? what SDR? and at the moment with this unit having taken the approach of using an FPGA ;-) Still haven't seen that signal synthesis in the 65mhz ----3ghz.

Did I say GreatWORK!

Mathison

Mathison:
I would not hesitate to order again from Helmut, and I was one of the ones with delivery issues. It is not Helmut's fault at all, other orders from him came quickly and in good shape. I would recommend paying the little extra to get insurance, which is probably a good idea for any international orders.

I've had delivery issues from various places. It once took over four months to get something from China. I looked and saw all kinds of bad feedback on the seller after I placed my order, and canceled it via PayPal. Then, four months later, it showed up. It seemed to be lost in China's outgoing customs somehow, at least that's what the final tracking showed.

Hi Terry,
I recently got and order from China via Hong Kong post for a reasonable shipping cost compared to DHL, etc., about 1/10th.
There was an explanatory note inside detailing the 8 different handling agents involved and stating that they can only guarantee it getting to their local post office and not what happens on it's route to the purchaser.

586. Re: More on Quisk and Fldigi working together

Yahoo group: n2adr-sdr
Date: 2012-06-04 20:55:48 UTC
From: df1bb
Topic: 546 Message: 586

Hi Jim,

many thanks for this implementation. Currently I'm using Quisk 3.6.2 together with fldigi and it works very well.
Now I'm very interested in using WSPR. Using the DGTL mode and Alsa loopback works fine, even TX (just got my first reports with only 0.5W out :-)). As WSPR has no control interface, except for CAT/Hamlib, I wasn't successful in controlling the PTT automatically. I tried using latest Hamlib with HiQSDR implementation but this uses direct access to the TRX over udp so Quisk doesn't see changes in frequency or the state of the PTT. My HiQSDR starts to transmit but I think Quisk won't send any audio to it.
Do you have any suggestion how I could at least control the Quisk PTT somehow?

Hi,

The key state is sent from HiQSDR to Quisk in the received sample UDP packets, so if you can set key-down in the HiQSDR then Quisk should start transmitting too. So it seems to me that PTT should already work. Or perhaps I don't understand how you are controlling HiQSDR. Does Hamlib send a UDP control message to HiQSDR to set the software key-down?

Linux has a "pseudo terminal" or "pty" feature that acts like a hardware serial port, but is software. You could connect Quisk to this serial port, and connect WSPR to the other side, and control everything that way. Are you running Linux or Windows?

Can you provide a reference for the HiQSDR Hamlib interface? I could not find it.

Jim

Hi,

>Does Hamlib send a UDP control message to HiQSDR to set the software key-down?

Yes, I think this is the way it is implemented. Frequency control also works.

>Are you running Linux or Windows?

I'm running Linux. I tried to get the pty interface working but without success yet. After modifying is_key_down.c to accept the usage of /dev/ptmx I could get a slave pts (/dev/pts/5) to use with wspr. Both quisk and wspr can open their device but it seems ioctl somehow doesn't work correctly on it.

>
> Can you provide a reference for the HiQSDR Hamlib interface? I could not find it.

I found this entry:
http://comments.gmane.org/gmane.linux.hams.hamlib.devel/3456

The code can be found here:
http://n0nb.users.sourceforge.net/

It's in kit/hiqsdr.c.

Hi,

yes sending the UDP message to switch to TX is the way Stephane implemented it.
Unfortunately it is for FPGA V1.1 only. I had no time to extend the API description document so far.
If someone likes to do i can share the Latex sources ;)

Regarding usage of /dev/ptmx i think i remember that you need to use some different function call to open the device in order to make the communication with the slave end working properly. I had such problems when getting ax25 kissattach working.

590. Virtual machine for HiQSDR/N2ADR

Yahoo group: n2adr-sdr
Date: 2012-06-14 10:09:49 UTC
From: df1bb
Topic: 590 Message: 590

Hi,

I have put together a Debian based VirtualBox machine for use with HiQSDR/N2ADR hardware.
It includes the following, preconfigured software:

- QUISK 3.6.2
- QVNA
- HiQScope
- Fldigi
- WSPR

QUISK is configured to use the ALSA loopback interface so Fldigi and WSPR can work with it
(set mode to DGTL in QUISK).
I also included some little dirty hacks so WSPR and Fldigi are able to set PTT.
User and password are both "sdr". Just use the "Import Appliance" function in VirtualBox.

http://www.bjoern-b.de/upload/debian_hiqsdr.ova (3.2GB)

Hi Bjoern,

great idea.
Would it be possible also to inlcude the DREAM DRM decoder software ?
It also accepts audio from the Alsa Loopback device.
Setting the frequency via the Hamlib would be possible as well but without feedback to Quisk i guess.

regards
Mario

The Wurth 7427051 has been superceded by the 72470511 but the aperture
is too small for the RG178.
The only way it fits is by removing the PVC outer sheath.

Into the bargain, they have 22 written everywhere but they only shipped
20. I've emailed Wurth UK.

Hi Sid,

it is important to remoce the sleeve from the coax and tin the whole shield to make it stiff. Then traighten the coaxial cable
(roll it on the table with a sheet of wood is the easiest way..)
and cut them into the correct length. This can easily be done by pressing a sharp knive on the tinned shield an roll the coax below the knive. Then take the two sides, brake the shield and remove the excess. Tínning is simply possible, because RG178 is fully made from PTFE and heat resistant to soldering temperatures.
Only the tinned shield will brake at the precutted place while the PTFE inner lead is untouched.

The sleeve removing of the Coax is essential because you have to place the Ferrite beads as tight as possible to the coax to get highest possible inductivity. Ferrite is not conductive so this is no problem.

best regards & 73

Helmut, DB1CC

Thanks Helmut,
I wondered if the new ferites had smaller holes than the ones you used.
No fear of the RG178 without the sheaf as that's how I've built many RF transformers - brass tubes and PCB end pieces to form a one turn winding.

OK, I'll tin the RG178 braid.
73 ... Sid.

Hi Sid,

yeah, i understand.
In principle it is no problem to make a kit of all BF filter parts,
i have all on stock.
But the many different caps where you need only one or two makes the
counting, marking and packing a horrible work wich costs more than the parts ;-(

But i will think about it and find a solution ;-)

@ the other hand, i can supply partly built BP flter panels with all
parts soldered but without toroids, wich can be the better solving of this problem. Offer going next few hours to my homepage.

73!

Helmut, DB1CC

Thanks Helmut,
I'd been thinking along the same lines and hoping that the Filter Kit
would be offered with only the Toroids to wind.
I'll check the site out later.
I emailed sales@... also asking for the shipping cost to
the UK for the following.
Preselector Built and tested
Filter Module set
Micrometals male and female connectors for Filter Module
Amidon T30 Toroid set
73 ... Sid.

600. New HamLib Code for HiQSDR

Yahoo group: n2adr-sdr
Date: 2012-07-07 16:26:46 UTC
From: jimahlstrom
Topic: 600 Message: 600

Hello all,

I was trying to control my hardware with hamlib and discovered that there are no "get" commands. Apparently the code predates the "Qs" command that returns the current state. The relevant file is kit/hiqsdr.c in the hamlib distribution.

I have been working on hiqsdr.c, and I added all the "get" commands. I also changed the attenuator code as this seemed incorrect. I am now ready to submit the new code to the hamlib developers.

I have two questions. Is anyone out there actually using hamlib? If so I can send the new code, and take feature requests. Second, is there anyone who can test the new code? I don't have the HiQSDR hardware, so I am flying a bit blind.

Jim

I tried hamlib 1.2.15_git upstream some months ago with and without grig
and found it was not up to date for the HiQSDR.
I can help with testing.
73 ... Sid.

Hi Sid,

I will send you the source file hiqsdr.c and the binary hamlib-kit.so in another email. You can use the command line program rigctl to do the testing. These commands are available in both get and set versions:

f Rx frequency
t PTT
y Antenna 1 or 2
l Level of PREAMP, ATT, RFPOWER
s Split VFO 0 or 1
i Tx frequency
m Mode CW or not CW (USB returned)

Thanks for testing.

From: jimahlstrom
Topic: 600 Message: 606

Hello,

I now see that I can upload the files to this group, so I have done so. Please feel free to test these new features. The hamlib-kit.so was made on the newest Ubuntu so maybe you don't need to rebuild HamLib from source.

Note that you should be able to use Quisk or other software to control HiQSDR and simultaneously use rigctl or other HamLib client to query (but not set) the hardware. That is, HiQSDR can handle multiple clients. But how to handle multiple clients that attempt to set parameters to different values is an unsolved problem.

608. Raspberry Pi and HiQSDR?

Yahoo group: n2adr-sdr
Date: 2012-07-24 18:43:58 UTC
From: dg9bfj
Topic: 608 Message: 608

Hello

I was looking for a shortwave SDR Trx that can be used standalone i.e. without the need of an extra PC. I have build the DL7IY SDR with analog I/Q mixer and AL3101 decoder. Then I came across this project and now I am thinking to swap over to use this concept. As I do not want to connect my laptop to the Trx all the time my idea was to use the Raspberry Pi <http://www.raspberrypi.org/> as the controller and a 7" touch screen (800x400) or similar to controll the Trx. This should all fit into a case that has the size of a modern Trx. The Raspberry is quite small and has all the needed components and costs only 35 GBP. Here are some details.

Raspberry Pi

* SoC Broadcom BCM2835 (CPU, GPU, DSP, and SDRAM)
* CPU: 700 MHz ARM1176JZF-S core (ARM11 family)
* GPU: Broadcom VideoCore IV, OpenGL ES 2.0, 1080p30 h.264/MPEG-4 AVC high-profile decoder
* Memory (SDRAM): 256 Megabytes (MiB)
* Video outputs: Composite RCA, HDMI
* Audio outputs: 3.5 mm jack, HDMI
* Onboard storage: SD, MMC, SDIO card slot
* 10/100 Ethernet RJ45 onboard network
* Storage via SD/ MMC/ SDIO card slot

Would this be possible? Has the Raspberry enough power for the SDR?

If this all works it would be nice later to add some sort of buttons for the direct frequency input and a dial for the frequency. The rest can be done via touch panel.

Any comments are welcome.

Marcus

Hello Marcus,

The Raspberry PI is getting a lot of attention here in the group lately. It has some very nice capabilities, but it may take some time for us to get a grasp on its real capabilities. I for one would like to play with the board, but I don´t own one yet. So far we know that the board lacks some things important for SDR -- like a stereo audio codec. We could remediate this by using an external USB codec. I am considering, however, offloading the DSP to an external DSP with its own codec and use the Raspberry PI (or the BeagleBoard) for the user interface (waterfall, etc) and control. TI has a USB stick that incorporates a DSP and an audio codec that is very promising for this purpose. The TLV320AIC3254 USB Evaluation Module.

Hello Marcus

i got a Raspberry Pi (B) last week and test the possibilities of this with HiQSDR
the next few days - but in my opinion, 700 MHz is not fast enough on this platform
for full Quisk operation.
The Raspberry also misses some audio features, so this is not the best solution, but
maybe it is working as a server for QTRadio - i'll keep you informed!

Helmut, DB1CC

So, that EVM has a USB 1.1 interface that will run at 12mbps. How exactly are you going to get 2 stereo pairs in/out at anything better than 48KHz?

The problem with quisk is it being written largely in python which is an interpreted language so the likes of the BeagleBoard XM and RasPi are not powerful enough.

On the Beagleboard XM the audio from quisk came in intermittent 1 second bursts.

I have had hiqsdr-server and dspserver running on the Pandaboard (not ES) but lately everything seems OK but it's not registering on the network. QtRadio audio-testing branch works.

With HiQSDR the Pandaboard is running quisk but I'm getting errors with OnGraphData, seen this long ago but can't remember what fixes it. There is no graph when the Graph button is active, graph but no waterfall when WFall button is active, sound is 100% OK.
73 ... Sid.

From: Sid Boyce
Topic: 608 Message: 613

I can't get the RasPi to play a simple .wav file. The only sound I have had from it was running QtRadio, disconnecting and as the waterfall quits I get HDMI sound from the LCD monitor until the disconnect completes.

I was hoping to use a USB 100Mbit ethernet for the 192.168.2.x interface but the 2 I have tried seem to cause errors on eth0 which fails and it doesn't return to the prompt until eth1 is unplugged.
The dm9601 module for eth1 gets loaded.
73 ... Sid.

I don't see why you need more than 48Khz ... its just nice to see more

So, that EVM has a USB 1.1 interface that will run at 12mbps. How exactly are you going to get 2 stereo pairs in/out at anything better than 48KHz?

Hello Marcus,

The Raspberry PI is getting a lot of attention here in the group lately. It has some very nice capabilities, but it may take some time for us to get a grasp on its real capabilities. I for one would like to play with the board, but I don´t own one yet. So far we know that the board lacks some things important for SDR -- like a stereo audio codec. We could remediate this by using an external USB codec. I am considering, however, offloading the DSP to an external DSP with its own codec and use the Raspberry PI (or the BeagleBoard) for the user interface (waterfall, etc) and control. TI has a USB stick that incorporates a DSP and an audio codec that is very promising for this purpose. The TLV320AIC3254 USB Evaluation Module.

Then I came across this project and now I am thinking to swap over to use this concept. As I do not want to connect my laptop to the Trx all the time my idea was to use the Raspberry Pi

as the controller and a 7" touch screen (800x400) or similar to controll the Trx. This should all fit into a case that has the size of a modern Trx. The Raspberry is quite small and has all the needed components and costs only 35 GBP. Here are some details.

Well, I guess a Pi probably won't be fast enough to run a HiQSDR anyway. I was thinking more along the idea of a QSD with enough bandwidth to show ARPR and beacon band simultaneously.

Hello

I would be nice to use the RasPi and Quisk because it is a very small and cheap single board computer. But we will see what your tests will come up with. Do you know of any other single board computers that can be used? I still have the dream to setup a SDR system with a reasonably priced board to install it in a 19" 3HU case. I think the BeagleBoard will also be to slow for the setup?

Marcus

Hi Jim,
I just got my HiQSDR board set up fro RX only and have done some
preliminary tests, more to follow.
I also tried grig-0.8.0 but that is looking for ttyS0 and does not start
- to be looked at later.

tindog:/opt/quisk-3.6.2 # rigctl -m 2514

Rig command: ?
Commands (some may not be available for this rig):

Topic: 608 Message: 620

I already mentioned above that quisk being written largely in python
which is an interpreted language needs resources beyond what the RasPi
can offer.

I'm running the raspbian distribution
root@raspberrypi:~# cat /proc/cpuinfo
Processor : ARMv6-compatible processor rev 7 (v6l)
BogoMIPS : 852.78
Features : swp half thumb fastmult vfp edsp java tls
CPU implementer : 0x41
CPU architecture: 7
CPU variant : 0x0
CPU part : 0xb76
CPU revision : 7

Hardware : BCM2708
Revision : 0002
Serial : 00000000f92c07c9
root@raspberrypi:~#
I still have not been able to get any sound out of the 3.5mm socket.
root@raspberrypi:~# cat /proc/asound/cards
0 [ALSA]: BRCM bcm2835 ALSbcm2835 ALSA - bcm2835 ALSA
bcm2835 ALSA
root@raspberrypi:~# fuser -v /dev/snd/*
USER PID ACCESS COMMAND
/dev/snd/controlC0: pulse 1217 F.... pulseaudio

Adding a USB Ethernet causes errors on eth0, ifconfig hangs until eth1
is unplugged.

Running quisk on the Pandaboard CPU usage is between 84% and 99% but the
audio is clean.

On a Beagleboard XM audio was in 1 second intermittent bursts so was not
intelligible.

While the Pandaboard is fine, the Pandaboard ES even more so, the
Hardkernel board with 4 1.4GHz cores looks like it would probably be the
best future board.
73 ... Sid.

This seems to have got stuck in the system somewhere since 31st. July.

Grig appears to be no longer maintained.

From: jimahlstrom
Topic: 600 Message: 622

Hi,

It looks to me that the code works. Is that correct? Did you find anything wrong? I want to send the code to the HamLib group soon.

Jim
N2ADR

```
Hi Jim,
So far many things work so it's worth sending upstream.
lancelot@slipstream:/HAMRADIO/SDR> rigctl -m 2514

Rig command: ?
Commands (some may not be available for this rig):
F: set_freq (Frequency) f: get_freq ()
M: set_mode (Mode,Passband) m: get_mode ()
I: set_split_freq (TX Frequency) i: get_split_freq ()
X: set_split_mode (TX Mode,TX Passband) x: get_split_mode ()
S: set_split_vfo (Split,TX VFO) s: get_split_vfo ()
N: set_ts (Tuning Step) n: get_ts ()
L: set_level (Level,Level Value) l: get_level (Level)
U: set_func (Func,Func Status) u: get_func (Func)
P: set_parm (Parm,Parm Value) p: get_parm (Parm)
G: vfo_op (Mem/VFO Op) g: scan (Scan Fct,Scan
Channel)
A: set_trn (Transceive) a: get_trn ()
R: set_rptr_shift (Rptr Shift) r: get_rptr_shift ()
O: set_rptr_offs (Rptr Offset) o: get_rptr_offs ()
C: set_ctcss_tone (CTCSS Tone) c: get_ctcss_tone ()
D: set_dcs_code (DCS Code) d: get_dcs_code ()
?: set_ctcss_sql (CTCSS Sql) ?: get_ctcss_sql ()
?: set_dcs_sql (DCS Sql) ?: get_dcs_sql ()
V: set_vfo (VFO) v: get_vfo ()
T: set_ptt (PTT) t: get_ptt ()
E: set_mem (Memory#) e: get_mem ()

Topic: 600 Message: 626

Hi Sid,

most probably because of the length your post was marked as spam and needed a dedicated approval. I did not notice it...

regards
Mario

From: Sid Boyce
Topic: 627 Message: 627

The latest circuit diagrams I have are for V2.6I and they seem at
variance with my Prelector board, e.g I haven't found JP3.
73 ... Sid.

I need to strap for PTT activated PA power (1W PA used) and using BPF's
for TX.
73 ... Sid.

Hi Sid,

JP3 its already there, but a little bit hidden ;-)

Yout will find JP3 on Top right over IC9, and for that option you have to connect PAD 2/3.
Then all TX signals will be routed via the filter actually selected.
If you connect PAD 1/2 instead, the preselector switches to "Bypass" always if TX is activated.

To clearify this, i uploaded two JPGs to the file area
called "Circuit_JP3" but all is included in the circuits and PCB files that are present in the file repository. Differences of versions
"I" and "K" (the actual version) is marginal.

73!

Helmut

632. HiQSDR + Prelector

Yahoo group: n2adr-sdr
Date: 2012-07-31 00:28:50 UTC
From: Sid Boyce
Topic: 632 Message: 632
Attachments: 1 described; binary payloads are missing from this source WARC

I just put the 2 together and running hiqsdr-server, dspserver and
QtRadio and tuned around 20m and 40m.
The two SMA couplers I imported from the USA as I could not find any in
the UK so it's put together like in the attached photo.

I'll leave it for tonight and try to take a photo when I'm awake in the
morning.

I'll also try quisk and qsdr.

I'll do some extra testing before I drill the enclosure to fit it in.
So far, so good.
73 ... Sid.

I have placed 2 photos in the G3VBV album.

Next task is drilling holes for the SMA connectors and cutting the cable slot in the Preselector enclosure.
73 ... Sid.

Hello

I am new in this group

I found this transceiver to be very interesting.
http://www.db1cc.de/page2.htmle
I have SDR-IQ and have been working with SDR-Radio software
and Spectravue.

What are possible software platforms supporting this transceiver ?.

Esko Petäjä
OH6MQM

Welcome Esko,
The HiQSDR is supported by quisk, qsdr, ghpsdr3-alex.
You can find out more by clicking on the Software link at hiqsdr.org.
73 ... Sid.

Hi guys,
Can you check I have the BPF's plugged into the right sockets ...
I have
160m J16/J22
80m J17/J23
40m J18/J24
30m J19/J25
20m J20/J26
17m J21/J27
15m J4/J10
12m J5/J11
10m J6/J12
6m J7/J13

ASEL0 and ASEL1 -- both open
JP3 2-3 bridged.
1W PA installed.
Antenna connected to BU3 of Preselector.
73 ... Sid.

Hi Sid,

  concerning the BPF's. I have not build all BPF yet and cann't check my system yet, but in principle the position sounds logical to me. If you encounter problems you can modify the file

quisk_hardware.py in quisk-3.6.3\hiqsdr\directory.

  Line 111 / comment out

```
  def ChangeBand(self, band):

    # band is a string: "60", "40", "WWV", etc.

    self.band = band

      comment out

    #self.HiQSDR_Connector_X1 &= ~0x0F  # Mask in the last four bits

    #self.HiQSDR_Connector_X1 |= self.conf.HiQSDR_BandDict.get(band, 0)
& 0x0F

      self.SetTxLevel()

    self.NewUdpStatus()
```

  and in Line 59 you can set whatever you want :-.) and check the BPF stuff and debug the code. But in this case the Quisk-band changing doesn't work. So do not forget to remove the changes :-)

  If you have the 1W PA plugged in und using Bu3 then you must have close ASEL0 (IMHO). I have tested these combination with my HiQSDR and Preselektor. Please check the circuit around Rel5.

  JP3, at the current state I'm working with the combination1-2 close. If you sure, that the BPF are working, than 2-3 should be fine. Btw. You have LED's on the BPF's so you can check the band changing stuff by checking the LED's :-)

  73! dg1vs

  Kind regards Karsten

From: Helmut Göbkes
Topic: 632 Message: 639

Hi Sid, Hi Karsten,

there is no need to change code!

Jim made the feature selecting Band pass filter positions freely
in the quisk_conf.py

Please add to your quisk_conf.py following lines:

```
# If you use the HiQSDR hardware, set these:
# The HiQSDR_BandDict sets the preselect (4 bits) on the X1 connector.
HiQSDR_BandDict = {'160':1, '80':2, '40':3, '30':4, '20':5, '17':6, '15':7,
'12':8, '10':9, '6':10, '80X':11, '40X':12 }
```

as you see, the first numer is the labeling of the band buttons and the second number is
the digital selection number of BP place within Preselector, (1=0x0001, 9=0x1001 ...)
but zero (0x0000) as BP selection is special than means that no Bandfilter is selected
and all BPs are passed by (ByPass LED lits on Preselector)
Also, if no valid Band label is selected, automatically selection of 0 (0x000) is assumed.
You also can see above the Band Labels 80X and 40X, these selects also 80 and 40 meter
bands
but with different Band filters (Cauer Filters)
With these selection schemes you can freely select filters
for frequency bands used.

Next few das i make a description of buildinf up Preselector and the specialities around
them
and set these here in the list

best regards & 73

Hi Sid,

there are some comments for Preselector using:

each module decides with the solder jumpers ASEL0 and ASEL1 following
behaviour:

ASEL0 open: separate RX/TX connectors BU1/BU2 is used
ASEL0 closed: Antenna connector BU3 and Driver ist used

ASEL1 open: No RX Bias is used on RX connector
ASEL1 closed +12V RX bias is feed in during reception (current limited)

This ASEL0 and ASEL1 jumper is also available on TOP of Preslector also (SJMP1) this is to select the behaviour if NO module is selected (Pass-Thru-Mode, Selecttion 0 =0x0000) is made

to Sid: You have to close the ASEL0 Jumper on all Filter modules for wich you want to use the driver and BU3 antenna connection!

further details follows...

OK, to summarize after looking at circuit again:-
On BPF boards - strap 3-4 (goes to pin 6 on J1)
SJMP1 - strap 1-2.
Antenna --> BU3.

646. AW: [n2adr-sdr] HiQSDR + Prelector

Yahoo group: n2adr-sdr
Date: 2012-08-10 20:03:22 UTC
From: Dr. Karsten Schmidt
Topic: 632 Message: 646

Hi Helmut, Hi Sid,

The most important thing is, to close the ASEL0 on every BPF and on the pass-through path. Helmut had explained this very well and I mentioned this also in my e-mail this morning.

Helmut also explained thoroughly the normal working behavior of the band switching using quisk, hiqsdr and the pre-selector board. But two things:

· I have a slightly different condition (use-case),

· since I prefer a step by step test and don't like a big-bang integration

At this time I have only one “filter-module”, and these filter-module is a wire between input and output + LED stuff, so this means, I have a second pass-through on a filter-module. But this was helping me to understand the band switching stuff . I haven’t prepared the coils yet L. In order to check the tx/rx-switch, I pull via changes in the quisk software (self.HiQSDR_Connector_X1 = 0 is fixed) the signal-path to “normal” pass-through on all bands and can test the 1W PA and the rx/tx-switch. Otherwise, every band-switch will result on my preselector-board in an open signal path …..

Maybe this sounds strange, put it worked for me J

I hope, this helps clarifying some of my thoughts in the morning.

Kind regards Karsten

Cc: g3vbv@...
Betreff: Re: [n2adr-sdr] HiQSDR + Prelector

Hi Sid, Hi Karsten,

there is no need to change code!

Jim made the feature selecting Band pass filter positions freely

in the quisk_conf.py

Please add to your quisk_conf.py following lines:

If you use the HiQSDR hardware, set these:

The HiQSDR_BandDict sets the preselect (4 bits) on the X1 connector.

HiQSDR_BandDict = {'160':1, '80':2, '40':3, '30':4, '20':5, '17':6, '15':7,

'12':8, '10':9, '6':10, '80X':11, '40X':12 }

as you see, the first numer is the labeling of the band buttons and the second number is

the digital selection number of BP place within Preselector, (1=0x0001, 9=0x1001 ...)

but zero (0x0000) as BP selection is special than means that no Bandfilter is selected

and all BPs are passed by (ByPass LED lits on Preselector)

Also, if no valid Band label is selected, automatically selection of 0 (0x000) is assumed.

You also can see above the Band Labels 80X and 40X, these selects also 80 and 40 meter bands

but with different Band filters (Cauer Filters)

With these selection schemes you can freely select filters

for frequency bands used.

Next few das i make a description of buildinf up Preselector and the specialities around them

and set these here in the list

best regards & 73

Helmut, DB1CC

Hi Rune,
Go with quisk for Linux, it's easy and it works well with the
HiQSDR+Preselector.

I'm also using the iw0hdv branch of ghpsdr3-alex and my rig is up on the
net accessible using QtRadio and aHPSDR/glHPSDR on my Samsung Galaxy S2
mobile. My rig is up there right now and is very popular.

Other software, qvna.py is in quisk, there is also qvna standalone and
hiqscope.

qsdr doesn't do Preselector band switching at present.
73 ... Sid.

That's the board I shall be ordering, the specs are excellent compared
to any other ARM board.
I have a Zotac Mag Mini PC, dual-core 1.6GHz (64-bit) that works fine,
so a quad-core 1.4GHz (32-bit) board should be more than adequate.

The dual-core Pandaboard runs quisk, no sound at the moment, but QtRadio
runs OK., hiqsdr-server and dspserver used to run fine but not lately
since I did a software update.
I'm building the iw0hdv branch on it to see if that will be OK again.
73 ... Sid.

I now have ghpsdr3-alex iw0hdv branch up with hiqsdr-server and
dspserver on the net with the Pandaboard and at the same time running
QtRadio on it.

Every time I do anything with QtRadio on Pandaboard I lose sound which
is restored by disconnecting and reconnecting.

```
# cat /proc/cpuinfo
Processor : ARMv7 Processor rev 3 (v7l)
processor : 0
BogoMIPS : 1598.59

processor : 1
BogoMIPS : 1554.48

Features : swp half thumb fastmult vfp edsp thumbee neon vfpv3 tls
CPU implementer : 0x41
CPU architecture: 7
CPU variant : 0x1
CPU part : 0xc09
CPU revision : 3

Hardware : OMAP4 Panda board
Revision : 0020
Serial : 0000000000000000
```

1Gig of memory.

The hardkernel board should be just fine for our use.
73 ... Sid.

Good. Maybe I should point out another pitfall in the quisk_conf.py: quisk might not start up if there are diacritical characters in the strings describing the audio devices. It seems the python parser throws an error there. This happens in German with our famous 'umlauts'. E.g. a headphone is decribed as 'Kopfhörer' (normally substituted in 7 bit ASCII as 'Kopfhoerer'). The same happens with 'Primärer Sundtreiber' (the primary audio device). I am not familiar with the Norwegian Windows localization strings, so this warning just in case...

660. Raspberry Pi running ghpsdr3-alex

Yahoo group: n2adr-sdr
Date: 2012-08-27 20:03:42 UTC
From: Sid Boyce
Topic: 660 Message: 660

I did a fresh clone and changed to the iw0hdv branch.
Removed all traces of -msse, -msse3 and -ffast-math

autoreconf -i

./configure CFLAGS='-O3 -pipe -march=armv6 -mfpu=vfp -mfloat-abi=hard'
CXXFLAGS='-O3 -pipe -march=armv6 -mfpu=vfp -mfloat-abi=hard'

make

Running hiqsdr-server at 48K and dspserver (built with qt4).

QtRadio running on another box using the connection from the server list.
Sound is a touch distorted, quite distorted on start up of QtRadio and
spectrum is always a little bit slow.

When a slave connected and tried changing frequency, dspserver crashed.

The first thing I tried on the Pi was QtRadio standalone, spectrum and
waterfall were OK but no sound.

Just now a client using glSDR (5) is attempting to change frequency,
sound went quite distorted then dspserver crashed.

Restarted dspserver and QtRadio sound started very distorted before it
settled down to reasonable.

That's what I asked some time ago, seems not.
If there was qt5 available it would take that load away from the main CPU.

There are many tutorials for building qt5 but none work. The build
software provided is i386 and it falls down building on 12.04.

With such long winded instructions it would have been nice if they
provided deb's rather than expecting us to build from sources with flaky
instructions or sources.

I shall ask on the forum and see what response I get.

667. ghpsdr3-alex master branch updated

Yahoo group: n2adr-sdr
Date: 2012-09-09 01:59:30 UTC
From: Sid Boyce
Topic: 667 Message: 667

Thanks to Andrea.

It now supports up to 960K samplerate.

With the latest QtRadio there is a spectrum zoom slider on the right
hand edge.
73 ... Sid.

668. HiQSDR TX problem.

Yahoo group: n2adr-sdr
Date: 2012-09-09 02:22:59 UTC
From: Sid Boyce
Topic: 668 Message: 668

I haven't had a chance to check over the Presector strappings once again
but I think I got them right first time and they are set as outlined in
my last email for help.

Neither from Quisk nor by connecting J1 2-6 no TX relay is heard activated.
ASEL0 closed
ASEL1 closed
SJMP1 - strap 1-2
Antenna --> BU3

The BPF switching is fine.

I have not done any VNA tests but the BPF's are very effective.
In ghpsdr3-alex BPF switching is achieved on a separate popup panel so
band switching consists of 2 actions, band selection in QtRadio and BPF
switching, antenna switching and attenuator switching on the popup panel.

So e.g selecting 20m in Qtradio with other than the 20m BPF selected,
signals disappear.
Filter Bypass is selected when QtRadio first comes up and selecting the
correct BPF for the band there is a slight decrease in signal due to
insertion loss but nothing dramatic.

With very strong signals I put some attenuation in.
73 ... Sid.

669. Re: HiQSDR TX Straps

Yahoo group: n2adr-sdr
Date: 2012-09-11 08:32:49 UTC
From: Helmut Goebkes
Topic: 668 Message: 669

Hi Sid,

> Neither from Quisk nor by connecting J1 2-6 no TX relay is heard activated.
> ASEL0 closed
> ASEL1 closed
> SJMP1 - strap 1-2
> Antenna --> BU3

You do not explain which ASEL straps you closed. There are ASEL0/1 straps on the Preselector board, these are used if NO Filter is selected and ASEL0/1 straps on each Filter modules too.

So you can decide on a filter by filter base if you use the BU1/BU2 separate connections (if ASEL0 is OPEN) or BU3 (if ASEL0 is CLOSED)

If no filter module is selected, the ASEL0 on the Preselector board routes the signal while the ASEL0 on the selected filter module does this if a filter module is selected. This means, to route the signals ** always ** via BU3 (and the PA) you have to close ALL ASEL0 straps - on preselector board AND the modules. Same is valid for the ASEL1 Straps which switches the 12V phantom power ON, but this makes only sense if ASEL1 Strap OPEN because phantom powering is only possible on BU1.

Antenna relay for BU3 switches only if ASEL0 jumper on the selected filter modules is closed!

best regards & 73!

Helmut, DB1CC

These are all the connections I have checked.

Filters:- ASEL0 (3-4) closed.
ASEL1 (1-2) open.

Preselector:-
JP2 -- (1-2) open (next to IC10)

JP3 -- (2-3) closed - Use Presel Filter for TX (next to IC6 and R45).

SJMP1 (1-2) closed - ASEL0
(3-4) open - ASEL1

Antenna connected to BU3.
73...Sid.

Hi John,
http://hiqsdr.finken-net.de/index.htm where you'll find almost all
details including a presentation.

Initially I used a RX/TX relay circuit including a level shifter that
allowed switching between the 2 SMA's and excellent SSB could be heard
on another transceiver. My RX/TX circuit was too slow for any serious use.
73 ... Sid.

677. New Quisk 3.6.4

Yahoo group: n2adr-sdr
Date: 2012-09-15 19:50:13 UTC
From: jimahlstrom
Topic: 677 Message: 677

Quisk Version 3.6.4 September 2012

I added Hamlib control to Quisk. Set your digital or logging program to rig2, device localhost:4575. See the Help and docs.html. This is used to control Quisk from other digital mode programs such as WSPR.

I added the Y scale to the graph above the waterfall.

Quisk can now record the speaker audio and the digital samples to a WAV file. Set the file names using the config screen, and then use the "FileRec" button to start recording. Press the Help button for more information.

678. Re: HIQSDR and Windows

Yahoo group: n2adr-sdr
Date: 2012-09-17 08:37:56 UTC
From: Helmut Goebkes
Topic: 647 Message: 678

Hi Rune,

HiQSDR and Preselector works very fine und Windows 7.
I am using both operating systems, Windows 7 Ultimate 64 Bit
and Linux, Ubuntu 12.4 - on both Quisk is working very successful,
but under Linux, Quisk works a little bit smooother.

Nevertheless, both are absolutely useful. ther are many programs who are working with HiQSDR, but Quisk is the "reference" programm operating HiQSDR.
Normally i am using Quisk under Windows 7 because my main Application, a 3D-CAD-System needs them.
You can use the "quisk_config.py" i stored in the files section as a base for Quisk - you only have to adapt the sound card interface.

I am using HiQSDR and Preselector with one of the first MPPA 10W-PA to be QRV and this combination works perfect. I got QSOs with just 10Ws over whole europe with good to excellent rapports.
Before some days, i coupled my Expert 1K-PA to the HiQSDR, using the 10W-MPPA (IP3<41dB!)
You have only touse the externat PPT output to switch the TX-Relay directly from the Presleector and route the
J3 Antenna Preselector output to the Expert 1K input. thats all.

Usinge the 10W MPPA as driver, my HiQSDR outputs >450W PEP
withput any problems, the HiQSDR & Presel Modules are
open and not specially shielded on top of the Expert-1K PA.......

The HiQSDR 100W-PA (HPPA) is currently under development and i think it will be available end of year as a series product.

Next weeks i set up a HiQSDR accessible
via Internet running QTRADIO Server and coupled
to my 3 Ele-SteppIr-Beam.
Sid has his Rig also in the Internet,
working very fine on 20m and up.

If you have any questions, please feel free to ask, here on the group are many skilled HAM's using HiQSDR ;-))

73!
Helmut, DB1CC

BTW: MPPA development is complete, it works really good and will be available in short time. I will upload the related Infos next days
to the files section.

Excellent Helmut,
I think you answered the question I was going to ask about whether the 1W driver was needed to drive the 10W MPPA. It's good to know it's not needed so I can divert it to my UHFSDR to provide 1W output.

I check almost daily to see when the 10W MPPA is available.
73 ... Sid.

Hi John,

The HiQSDR is a complete, full digital DDC/DUC transceiver module,
no additional modules are neede for operation as transceiver.
The HiQSDR operates with a PC via Ethernet network with 100MBit/sec.

The RX and TX Parts are full duplex, so both can be operated simulateously or separate.
The RX sensitivity (MDS) is about -128dBm
TX delivers a 17dBm Signal (50mW) but is software programmable in 256 Steps from
0 to 18 dBm. IP3 is better than 45dB at 10dBm.
HiQSDR has a digitally programmable attenuator on board wich is programmable
from 2 to 42dB via software.

The price of a HiQSDR module is EUR 589.-- incl. VAT.
We can deliver the HiQSDR Module from stock,
Preselector Module has delivery time of 3-4 weeks after order.
Package & Postage to UK is EUR 18.-- insured & registered DHL package
payable to

Bank Hypovereinsbank Landsberg
Account Holder Technologie 2000 GmbH
IBAN DE57720200706110181866
SWIFT (BIC) HYVEDEMM408

alternatively you can pay also via paypal to hgoebkes@...

I tried it on the ODROID-X and got some errors I haven't yet found the cause of.

I've built ghpsdr3-alex on the ODROID-X and currently running QtRadio on it. Andrea's latest changes to his iw0hdv branch being used - he added preamp control last night.

If I get around to it later I'll try hiqsdr-server and dspserver running on it also, hopefully at 960Ksps.

wxGTK all looks fine.

Hello Serge,

Thank you for the report.
Is any definition necessary in quisk_conf.py?

btw,
I am new in HiQSDR and Quisk also no experience using Hamlib.
begin to reading
http://sourceforge.net/apps/mediawiki/hamlib/index.php?title=Main_Page

Thanks again.

Hello Hisami,

No any special - all what in
http://james.ahlstrom.name/quisk/docs.html

I use for FLdigi XML CAT not Hamlib,and all OK with DIGL mode.
Pair FLdigi+Quisk work fb for CAT and VAC (add rows for it in quisk_config)
digital_input_name = "Line 2"
digital_output_name = "Line 1"

I understood for Hamlib you must to try latest version where use rig : nr.2 Hamlib rigctrl Net with localhost:4575
Also it show in quisk_default (in main directory Quisk)

Hi,

thanks for the excellent piece of software.

I have had a minor inconvenience when installing quisk on Linux: it seems that "python setup.py install" misses the usb/backend directory when copying files to system location. With this copied manually, Softrock RX works great.

Regards,

Ulo

Hello Serge,

Thank you for the informations.

I formatted HDD, and installed Windows 7 English version
and Ubuntu last night.

I will try clear install to the new environment.

Your report is cheers up me.
Thanks again.

690. Preselector FDX LED permanently on

Yahoo group: n2adr-sdr
Date: 2012-10-02 20:27:47 UTC
From: Sid Boyce
Topic: 690 Message: 690

I have been trying so far unsuccessfully to trace what exactly controls this LED.

My configuration is Antenna at BU3 for RX and TX and switch to TX operation by PTT.

DUPLEX/ on HiQSDR X3 is not connected.
73 ... Sid.

From: Helmut Göbkes
Topic: 690 Message: 691

Hi Sid,

This LED is controlled by Preselector X2, Pin7, signal name CCTX wich is a spare signal.
This signal is pulled to logic high (3.3V) with a 10k Resistor (to X2,Pin9) to inactivate this
signal. Mating on HiQSDR is X2,Pin7 and FPGA Pin 56. This pin on the FPGA
is unprogrammed and therefore in high impedance state.
If this signal is pulled low, REL3 (and FDX-LED) is activated and both HiQSDR signals path RX and TX are connected directly to the corresponding RX/TX SMA connectors BU1/BU2.

This works only if the active Filtermodule also has selected BU1/BU2 as connections.
This is a feature to be used later, because it needs Firmware code support in FPGA
wich is not done now.

Under normal circumstances, this LED should never lit, because it is üulled up to 3.3V
to be inactive (Pull-Up from X2,Pin7 10k to X2,Pin9).

Best regards!

Helmut, DB1CC

I am receiving using BU3 with the FDX LED always on.

X2 pin 9 via the cable to HiQSDR X1 pin 9 should be holding it high.
I'll check the cable for connectivity.

693. Pulsing IQ

Yahoo group: n2adr-sdr
Date: 2012-10-26 08:26:03 UTC
From: zl2apv
Topic: 693 Message: 693

Hi all,

First post so be gentle. I have a problem with my HiQSDR whereby the audio pulses and distorts for about 5 secs approximately every 5 minutes. The spectrum is also affected at the same time.

I am using xubuntu 12.04 LTS running Quisk or ghpsdr3-alex and the fault appears on both. It seems to be in the HiQSDR board itself and also the first 2 or 3 seconds of TX is not right ssb or cw but more info on that later when I check it further. The VNA works correctly to further add to the mystery.

I will place a .wav file and a screenshot of the problem in a ZL2APV folder in the files section for those who may be able to help. Thank you for taking the time to read this post and I will appreciate any help I can get.

73 Graeme ZL2APV

HI Graeme,

it looks like you are running out of I/Q samples or a network problem.
Do you have any other heavy load @ your network like streaming video, video on demand service or so?
The distorted spectrum looks linke wrong or missing I/Q values.

other possibility is a wrong quisk_config.py. before Version 3.6,
i used the "graph_refresh" parameter often with more than 15, because my computer is fast enogh. After that version all refresh rates
over 10 results in periodically stops in Waterfall and distorted audio.

How is the HiQSDR connected to the PC via a Cros cable (not suggested)
or via a switch?
On the other hand, if QuiskVNA works, all on HiQSDR should be ok because the internal logic is identical and only the (frequency" is swept.

Can you try the Hardware PTT/CW key connection on the bord? is TX behaviour the same?

best regards & 73!
Helmut, DB1CC

Hi Helmut,

Thanks for the tips. I will look into these but will be away for two days so there will be some delay.

My network setup is that the HiQSDR is plugged into the adsl modem ethernet port and the computer connects to the modem via wifi. It may be a speed issue and I will try direct ethernet connection of the computer to the modem although it runs all my other sdr's ok but only tried 96 KHz on them. Yes buffer under runs seem very likely, I will respond soon.

Tnx es 73, Graeme ZL2APV

Topic: 693 Message: 696

Hi Graeme,

i also sometimes use the setup similar to you.
The HIQSDR is connected to the network switch and the PC via Wifi.
This usually works stable up to 192kSpl/s if the network is not busy with something else.
With higher rates usually problems will appear.
You can see datalosses in the setup window of Quisk. There is a counter increasing if data is lost.

regards
Mario

Hi Graeme et al!

Graeme i first had the same issues. At my server, currently online, both hiqsdr and the hiqsdr-server machine (hiqsdr-server and dspserver) are connected by lan to the vDSL router. I access the server the with QtRadio via Wifi with no problems.

If the dspserver mashine uses wifi also, maybe thats the bottleneck?!

From: Guenter DL7LA
Topic: 693 Message: 698

Hi, Graeme,

exactly the same problem here (using a Compaq 6720s) and running Mint Maya which is based on Ubuntu 12.04 LTS. Another notebook running Ubuntu 10.10 does not show this effect.

In a renowned German computer magazine a fortnight ago there was a letter to the editor on the same issue. An Atheros WLAN Module loses periodically (every 2 minutes) the connection to the base. Syslog contains a cryptic message like '...deauthenticating...by local choice(reason=3)...'.

Their staff suggests as a workaround to disable the IPv6 support for the WLAN connection. It looks like the network manager tries to connect to new cells in a regular background scan.

Some other suggestions for notebooks seem not applicable here unfortunately. These include locking the client (that would be quisk in effect) to the BSSID/MAC adress of the WLAN station.

I have still to find that setting in my adapter though.

From: rune
Topic: 699 Message: 699

Hi gents

I finally got around and get an working img on my Odroid-X
Ubuntu HDMI.RC5

Installed latest Quisk and yes the first sound from the HIQSDR was there :-)

I am a newbie on Linux so i need all info and help i can get.
Here is the errors i got, i don't have any panadaper
or WF, scope etc.

Yes the error i think is related to this, so please any help :-)

73 Rune LA7THA/MM

From: Sid Boyce
Topic: 690 Message: 701

Hi Helmut,
Measured the following.
IC7-12 +0.03V
IC7-8 0V

IC7-8 --> IC5-11 Low in would turn IC5-10 FDX_ON High.
I have yet to check HiQSDR X1-9 and Preselector X2-9 for +3.3V - a job
for tomorrow.
73 ... Sid.

Hi Helmut,
Measured the following.
IC7-12 +0.03V
IC7-8 0V

IC7-8 --> IC5-11 Low in would turn IC5-10 FDX_ON High.

R51 (X2-9) +3.29V
R51 other side +0.29V
73 ... Sid.

Hi Guenter and all who have responded,

Many thanks for your time and interest, your help is appreciated.

I am now convinced there is nothing wrong with my HiQSDR and the problem lies with my networking but of course I can never rule any one thing out yet.

I can't disable my ipv6 and have tried two methods plus the ignore option. I think some other software is re-establishing it after boot up and am suspicious that it is the problem.

My setup is ...

```
gvj@E1505:~/programs/quisk-3.6.4$ sudo ifconfig wlan2:1 192.168.2.1
[sudo] password for gvj:

gvj@E1505:~/programs/quisk-3.6.4$ ifconfig
eth2 Link encap:Ethernet HWaddr 00:15:c5:14:cc:12
UP BROADCAST MULTICAST MTU:1500 Metric:1
RX packets:0 errors:0 dropped:0 overruns:0 frame:0
TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:1000
RX bytes:0 (0.0 B) TX bytes:0 (0.0 B)
Interrupt:17

lo Link encap:Local Loopback
inet addr:127.0.0.1 Mask:255.0.0.0
UP LOOPBACK RUNNING MTU:16436 Metric:1
RX packets:11234810 errors:0 dropped:0 overruns:0 frame:0
TX packets:11234810 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:0
RX bytes:6149598401 (6.1 GB) TX bytes:6149598401 (6.1 GB)

wlan2 Link encap:Ethernet HWaddr 00:13:02:5d:79:00
inet addr:192.168.1.22 Bcast:192.168.1.255 Mask:255.255.255.0
UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
RX packets:3309726 errors:0 dropped:0 overruns:0 frame:0
TX packets:135675 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:1000
RX bytes:591321290 (591.3 MB) TX bytes:20296363 (20.2 MB)

wlan2:1 Link encap:Ethernet HWaddr 00:13:02:5d:79:00

UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
```

As a side issue I am using a laptop and would like the 192.168.2.196 to be sticky rather than have to be loaded each time I wake up my computer and would appreciate any pointers.

Using Quisk when the fault condition occurs the following is observed on the config screen ...

Sample Interrupts go jerky
Capture radio samples increase rapidly (latency remains stable)
Capture microphone samples latency becomes jerky with high numbers errors are 0
Play radio sound latency goes to 0 and errors increase

Using ghpsdr3-alex gives the same faults and I have run the HiQSDR at a sample rate of 48000 with no improvement in performance so I assume that network speed is not the bottleneck.

I wonder if it would be a good test for me to make pu a twisted ethernet cable and direct connect the HiQSDR board to my laptop and take the router out of the loop?

Obviously I am very keen to fix this as of course it prevents me from going on air with the frequent stoppages.

Topic: 693 Message: 704

Hi all who have been looking at my problem, I have made up a cross connect cable and although it is difficult to get a connection when it finally does connect Quisk and HiQSDR run perfectly so now I have isolated the problem to my local lan setup.

With the cross connect cable I lose the connection every little while and need to use the command 'sudo route add 192.168.2.196 dev eth2' to restore the connection. I am not so worried about the unstable connection as it is not my intention to run the radio this way although I would be very interested to know if there is a way to permanently add 192.168.2.196 to my router table on the PC.

I am suspicious of IPv6 but as posted earlier I can't seem to disable it. Even when I am the only computer on my local lan with no extra activity my pulsing fault is there and I doubt bandwidth is the problem but at this stage nothing is certain.

I have used ghpsdr3-alex with HiQSDR and this is the error message I get

```

Hi Graeme,

the messages above mean that we are receiving badly out of sequences
frames from radio hardware, so, I believe the network layer is
experiencing troubles.

Concerning IPv6, I wouldn't say that it can be harmful.

706. QtRadioManager: A database driven frequency and recordings manager for QtRadio, Quisk and others

Yahoo group: n2adr-sdr
Date: 2012-11-03 11:30:01 UTC
From: Oliver Goldenstein
Topic: 706 Message: 706
Attachments: 1 described; binary payloads are missing from this source WARC

Hi All !

I put together a little piece of software. It is a learning project for me
and in an very early stage.

Please refer to the README for using it with Quisk at github:

You will find the program here:

https://github.com/dl6kbg/qtradiomanager

Looking forward to see your feedback/ suggestions.

73 Oliver DL6KBG

Hi Andrea,

Thanks for the response. The fact that the radio works perfectly on a cross cable direct connect makes me think all is OK on my computer and HiQSDR and as you suggest IPv6 is not contributing to the problem. It seems it is in my local lan. I need to do some learning as I am very inexperienced with networking but at least I know where to start looking now.

Looking forward to having my radio on line soon.

tnx es 73 Graeme

One thing that comes back to my mind:
In the past i wondered about drops in video streaming in my wired lan error as well as problems with my file share. I nailed this down that it just happened if a windows PC was online in the network (Wifi or wired does not matter). Some sessions of debug of the network traffic showed that some communicator functions in Windows use the same port that is used for upnp multimedia plug&play. This caused some strange responses which caused a reset of the spanning-tree routing of all switches that were in between. Then it needs some seconds until the switch learns all routes again. Pherhaps something similar happens in your network.

regards
Mario

Hi Mario,

Thanks for your suggestions. I don't have any windows computers on my local lan, just Linux and Android but your suggestion of the router needing to relearn the routes sounds in line with my symptoms or somehow scrambling the udp packets out of sequence so I am off to learn how to observe my network traffic :-)

Thanks and 73,
Graeme

711. Pulsing IQ - Solved

Yahoo group: n2adr-sdr
Date: 2012-11-05 02:33:17 UTC
From: zl2apv
Topic: 711 Message: 711

Hi All,

First a big thank you to all who helped with my problem.

After being steered to a probable local lan setup I eventually rebuilt everything including resetting the modem/router and rebuilding my connections.

I also have as a temporary measure set my netmask to 255.255.0.0 which although opening up my local lan I think is fairly secure being hard wired (I stopped using the wireless connection). Now it is not necessary for me to add to the routing table.

My next step is to change the HiQSDR to the net address of 192.168.1.196 to keep everything on the same net address group but that is my next learning curve as I have never programmed an FPGA before.

Away in hospital for a couple of weeks so will continue when I get back. I must say I am delighted with my HiQSDR and feel I got great value for my money. My ideal rig is nearly here.

712. IQ Demodulator ?

Yahoo group: n2adr-sdr
Date: 2012-11-07 13:10:33 UTC
From: Mario
Topic: 712 Message: 712

Hi all,

this is probably a question that goes towards Jim but i also want to find out if this makes sense at all...
Background is that during the weekend i tried to run CwSkimmer after a SDR software. The problem was that the Skimmer software expects IQ signals as input in order to get the full bandwidth. Currently i know of no SDR software that provides complex IQ demodulated signals instead of real signals. Therefore just half the bandwidth can be used there.
Woulnt it make sense to make this configurable for the DGTL mode somewhere in Quisk ? Then any other SDR software could be daisychained to Quisk.

What do you all think ?

regards
Mario

717. Quisk Version 3.6.5

Yahoo group: n2adr-sdr
Date: 2012-11-12 18:06:56 UTC
From: jimahlstrom
Topic: 717 Message: 717

Quisk Version 3.6.5 November 2012

I added a waterfall method ChangeRfGain() that enables you to keep the waterfall colors constant
for changes in the RF gain control. See my n2adr directory for an example of how to use it.

I added the ability to connect Quisk to the hamlib rigctld daemon. This enables Quisk to work
with any rig compatible with hamlib. For an example, see quisk_conf_kx3.py. Push the Help button
for documentation.

I added a feature to measure the frequency of a continuous RF signal. Right click the S-meter window
to turn it on. Push the Help button for documentation. It is meant for precise frequency measurement
such as would be needed to characterize crystals for a filter. Precision is 0.01 Hertz.

[Power has been out for 14 days due to hurricane Sandy.]

718. Re: Quisk Version 3.6.5

Yahoo group: n2adr-sdr
Date: 2012-11-14 15:28:28 UTC
From: jimahlstrom
Topic: 717 Message: 718

In Quisk 3.6.5 the frequency measurement feature does not work in CW mode because the feature does not work with RIT. For now, please measure frequencies with RIT turned off. I will fix this in the next release.

[P.S. We got our power back last night]

Jim

Hey Jim,

thanks for the new version and the information.
Good to hear that you recover from Sandy.
Several customer from work here have serious impacts as well.
Many offices closed for quite a while and so on...
All the best ! I will try your software soon again as well. Still thinking about the IQ-DSB demodulator to connect the SO2SDR software to Quisk. You should have a look to
http://code.google.com/p/so2sdr/
Probably thats also of interest for you.

regards
Mario

720. Re: IQ Demodulator ?

Yahoo group: n2adr-sdr
Date: 2012-11-16 20:15:08 UTC
From: Mario
Topic: 712 Message: 720

Hi all,

today i brought my HiQSDR board back to life with my 6.5V switched power supply i recently build. While trying a bit with the DGTL mode and CWSkimmer i noticed that the filter cannot be set to bandwith bigger than 6kHz anymore. Is this configured somewhere in the python files ?
It came to my mind that it would be very usefull if it is possible to use the samples from the frontend directly to stream it to the skimmer application. This should be not too difficult to use the IQ samples with a maximum of 192kSpl/s and put it to the Alsa loopback device. Then the skimmer would always get the full bandwidth and the demodulator in Quisk can be tuned independently.
What do the others think about that ?
My goal is to use the setup for CW contesting with some supporting tools like CWSkimmer or SO2SDR. Especially for SO2SDR the samples directly from the frontend would be usefull.

regards
Mario

There is hardly any need to understand python when dealing with quisk.
Once the application is installed and launched with the correct hardware
config file, that's it.

My first encounter with python was with quisk and that was at a very
early stage when I asked Jim to port to Softrock and he was sending on
versions for me to test as he had no Softrock gear.

I started learning python but never got very far - too many other
projects and distractions.

Though I deal exclusively with Linux where there are more steps to be
followed than installing a .msi file I have provided easy ways for
others to install, configure and use quisk for use with Softrocks and
UHFSDR.
With HiQSDR there have been no issues.

The only other software that runs on both OS's is ghpsdr3-alex on
http://napan.ca/ghpsdr3/index.php/Main_Page
There is a Windows binary zip package provided, discussions take place
on sdr-widget group on Google.

Hi Sid, 73s!
Tanks for informations.
I have installed Pyton 2.7 and WxPython at my computer (with windows) but my understand about it is zero.
When i execute Quish i receive one window with this information: "Quisk requires wxpython for Python 2.7 - Not found" and the instalation is aborted.
My problem is the software, I think install the software and only after having mastered the Quisk or other soft then purchase HiQSDR kits.
I go to read more about python and look the link you sent me.
The only thing is currently halting my HiQSR acquisition is the software platform but with your help I'll get there :-)
Best regards, 73s

Hi Silvio,

i installed Quisk on several Windows PCs. Sometimes it complains about missing libraries. But when you got it working once its fine.
Installing and trying Quisk prior to purchasing hardware is a good idea i think.
Please carefully read trough the instructions on Jims web page. All the things that are written there need to be done.
Did you also install pyserial ? Probably the error message is missleading or some files are just not in the right directory.
Which Windows do you exactly use ? Probably someone can reproduce your issue.

regards
Mario

Hi Mario 73s!
I tried installing on a PC with Windows7 and another with WindowsXP, but the result was exactly the same.
I normally use PowerSDR with a clone SDR1000 but the Quisk is very different and hence some difficulty at this early stage. I think with helps to be able to solve the problem.
I have a pc available only for working with SDRs, next week I will install Teamviewer, and maybe someone can help me remotely install and configure Quisk.
However I will continue to read the documentation to see if I understand where I am going wrong.
I'll give news soon.
Best regards Mário, 73s
Silvio

Hi Silvio,

i installed Quisk on several Windows PCs. Sometimes it complains about missing libraries. But when you got it working once its fine.
Installing and trying Quisk prior to purchasing hardware is a good idea i think.
Please carefully read trough the instructions on Jims web page. All the things that are written there need to be done.
Did you also install pyserial ? Probably the error message is missleading or some files are just not in the right directory.
Which Windows do you exactly use ? Probably someone can reproduce your issue.

regards
Mario

Problem still not resolved.

With the cable removed from either HiQSDR X1 or Preselector X2 R51 is 10K.

With both ends of cable connected R51 reads 1.5K.

Powered up:-
R51 at the X2 pin 9 end to GND is +3.29V, at the other end of R51 (going
to RN5) to GND is +0.29V.

IC7-12 +0.29V *** Looks like floating level.
IC7-8 0V

IC5-1 +4.97V
IC5-2 0V
IC5-11 0V
IC5-10 +4.97V

With the cable removed the FDX LED still comes ON.

Hi Silvio,

which version of wxpython did you actually install ? From documentation i read that it changed to version 2.8 and i have some difficulties on a old linux installation too while it works out of the box on my ubuntu 12.10 system. Probaly its just a incorrect version. I will try in my Windows7 VM.

regards
Mario

Hi Mário, 73s!

In my portable pc i have installed the file wxPython2.9-win32-2.9.4.0-py27.exe
Can it really be a problem in some storage folder, if not is it in correct location.
Tanks for help.
Regards,
73s!

Hi Sid,

sorry for dely answering your question i am in hurry curretnly but as short:
do never measure resistance in active systems because the resistance has no real relation to the circuit. Resistances in active circuits are done by active current sources with is so resistance measures mens simply: nothing.
Never leave inputs on Preselector open, because
the inputs are floating and therefore the states undefined.
Inputs should always be connected to HiQSDR or any other contral circuit with active 3.3V signals but never be open!

I have a look on your signals and explain detailed later!

73!
Helmut

On 03/10/12 08:38, Helmut Göbkes wrote:

Hi Sid,

This LED is controlled by Preselector X2, Pin7, signal name CCTX wich is a spare signal.
This signal is pulled to logic high (3.3V) with a 10k Resistor (to X2,Pin9) to inactivate

this
signal. Mating on HiQSDR is X2,Pin7 and FPGA Pin 56. This pin on the FPGA
is unprogrammed and therefore in high impedance state.
If this signal is pulled low, REL3 (and FDX-LED) is activated and both HiQSDR signals path
RX and TX are connected directly to the corresponding RX/TX SMA connectors BU1/BU2.

This works only if the active Filtermodule also has selected BU1/BU2 as connections.
This is a feature to be used later, because it needs Firmware code support in FPGA
wich is not done now.

Under normal circumstances, this LED should never lit, because it is üulled up to 3.3V
to be inactive (Pull-Up from X2,Pin7 10k to X2,Pin9).

Best regards!

Helmut, DB1CC

I have been trying so far unsuccessfully to trace what exactly controls
this LED.

My configuration is Antenna at BU3 for RX and TX and switch to TX
operation by PTT.

DUPLEX/ on HiQSDR X3 is not connected.
73 ... Sid.

Thanks Helmut,
I have worked with TTL, CMOS and ECL and I thought the circuits with 74HCT could be treated the same as TTL and CMOS, just different voltage levels applying.

Hi Sid,

in principle, you are right, related to the voltage trip levels
for high and low. That is the reason HCT circuits are works
as 3.3 Volt level digital converter for inputs,
because the trip point for logic high is defined to be >=2.4 Volt
and logic low <=0.4 Volt
But different to TTL or LSTTL, the input impedance is nearly
as high as CMOS. Inputs are protected against static discharges
but due to the high impedance , open inputs results in
a stochastic digital logical level or function.

Maybe one of your connecting wire is open ?

73!
Helmut, DB1CC

732. Quisk on Ubuntu 12.04 issue with wxgtk

Yahoo group: n2adr-sdr
Date: 2012-11-18 20:21:27 UTC
From: Mario
Topic: 732 Message: 732

On my laptop with Ubuntu 12.04 LTS i have a issue that quisk 3.6.5 does not start. It complains about missing python-wxgtk although python-wxgtk2.8 is installed.
Obviously python tries to import another version.
There is a method to force python to use version 2.8.
In quisk.py before the line with "import wx"
two lines need to be added:
"import wxversion" and
"wxversion.select('2.8')"
After that Quisk started on my laptop. On my Ubuntu12.10 x64 system this was not necessary.
Just in case someone else has the same issue.

regards
Mario

733. Re: [n2adr-sdr] Preselector FDX LED permanently on

Thanks Helmut,
Last night I checked to make sure there were no pigtails that could cause a short and I even started checking the cable for continuity which was difficult using multimeter probes.
I have some jumpers safely put somewhere - I'll hopefully find where the safe place is.

If not I'll make up a new cable.

I shall do that and report back.
73 ... Sid.

Hi Sid,

from the trace i think thats a problem with withing python-wxgtk itself. At least if i understand it correct with my limited programming skills.

"/usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/_gdi.py", line
> 856, in BitmapFromBuffer
> return _gdi_._BitmapFromBuffer(width, height, dataBuffer)
> RuntimeError: Failed to gain raw access to bitmap data.

What plattform is the ODROID-X ? Probably there is already a bug report or a patch there.

regards
Mario

Hi Mario,
The ODROID-X is a quad core ARM A9 embedded board.

It is running Ubuntu 12.10 so I'll post a query to the odroid and Ubuntu ARM forums.
The different levels for 12.10 on each:-
ARM
---
ii python-wxgtk2.8 2.8.12.1-6ubuntu2

x86_64
---
ii python-wxgtk2.8 2.8.12.1-11ubuntu3

There could be differences between the source from which each was built.
73 ... Sid.

737. Re: IQ Demodulator ?

Yahoo group: n2adr-sdr
Date: 2012-11-19 19:09:24 UTC
From: Mario
Topic: 712 Message: 737

Tried a bit with Quisk and SO2SDR.
Some things that would be nice (just to write down some ideas):
- Usage of the loopback soundcard also for other modes than dgtl. In general one would either like to pass the complete samples to the loopback soundcard or a second demodulator with large bandwidth. For example run CW in Quisk and pass +-24kHz complex around the current frequency to SO2SDR (or the complete samples with 96kSpl/s maximum
- separate volume adjustment for the output to loopback. Currently i need to set to really low volume in quisk to get low enough audio at fldigi or so2sdr.

> today i brought my HiQSDR board back to life with my 6.5V switched power supply i recently build. While trying a bit with the DGTL mode and CWSkimmer i noticed that the filter cannot be set to bandwith bigger than 6kHz anymore. Is this configured somewhere in the python files ?
> It came to my mind that it would be very usefull if it is possible to use the samples from the frontend directly to stream it to the skimmer application. This should be not too difficult to use the IQ samples with a maximum of 192kSpl/s and put it to the Alsa loopback device. Then the skimmer would always get the full bandwidth and the demodulator in Quisk can be tuned independently.

The problem was that the Skimmer software expects IQ signals as input in order to get the full bandwidth. Currently i know of no SDR software that provides complex IQ demodulated signals instead of real signals. Therefore just half the bandwidth can be used there.

Hi Helmut,
The cable is OK.
I metered the interconnecting cable, all wires are connected and there
are no shorts, pins out of place or retracted.
73 ... Sid.

740. QtRadioManager / FrequencyManager updated

Yahoo group: n2adr-sdr
Date: 2012-11-21 18:42:48 UTC
From: Oliver Goldenstein
Topic: 740 Message: 740

Hi All !

I have a new version on github, which allows to configure the hamlib port
for QtRadio, Quisk and Rigctld.

http://www.oliver-goldenstein.de/qtradiomanager

Sorry the Windows build has to wait. Still have problems with cross compile
and deployment.

73 Oliver DL6KBG

741. Re: [n2adr-sdr] Re: Quisk on Ubuntu 12.04 issue with wxgtk

Yahoo group: n2adr-sdr
Date: 2012-11-22 02:21:00 UTC
From: Sid Boyce
Topic: 732 Message: 741

Some Progress, changed quisk.py
from
bmp = wx.BitmapFromBuffer(len(row) / 3, 1, row)

To
bmp = wx.BitmapFromBufferRGBA(len(row) / 4, 1, row)

That's the display problem fixed - but graph and waterfall very jerky.

Getting blotches of sound heavily modulated by what sounds like horses
trotting even at 48K samplerate while there is no problem with QtRadio
at 480K samplerate probably because quisk is mainly written in python
and ARM seems not to be able to handle it, even with a Quad core 1.4GHz
CPU, 1G of memory and 3G of swap.
73 ... Sid.

742. Re: Software to control HiQSDR (windows preference)

Yahoo group: n2adr-sdr
Date: 2012-11-22 12:13:42 UTC
From: Mario
Topic: 721 Message: 742

Hi Silvio,

i tried with a PC with native Win7x64. Python 2.7, wxPython 2.8 (both 32bit).
Quisk 3.6.5 starts without problems here. Did you install the 32bit version of Python ?
According to Jims notes this is necessary:

...
Quisk now runs on Windows XP and Windows 7. The new Windows Quisk installs easily from a quisk.msi installer file, and adds its menu items under Start/Programs. You must install a 32-bit version of Python 2.7 and wxPython before you install Quisk. You must use the 32-bit version even if you have 64-bit Windows because the Quisk extension module is 32-bit. Quisk installs itself as a package under site-packages under Python 2.7. To uninstall Quisk, use Control Panel/ Add Remove Programs. You may need to adjust the config file parameters data_poll_usec and latency_millisecs depending on your hardware
...

If thats already the case i would suggest to move from wxPython 2.9 back to wxPython 2.8.

If you do not manage to get it running please paste the console output here.

regards
Mario, DH5YM

From: CT1BPT
Topic: 721 Message: 743

Hi Mario, 73s!

After several attempts with various versions of python and wx pyton could finally put Quisq working.
I have installed in sequence the files:
python-2.7.3 (windows installer)
wxPython2.8-win32-unicode-2.8.12.1-py27
quisk-3.6.4.win32-py2.7 (windows installer)

Now Quisk run, need configuration but i think its all ok.

I have send you a private message but for now you can ignore.
Tanks for help and best regards
73s! :-)
Silvio

Topic: 746 Message: 746

Yesterday i tried a bit with a relatively new digital voice mode for shortwave.
Since a long time David Rowe VK5DGR works on a open-source low-rate voice codec. This project is called codec2.
Now a variant of this codec is used in a amateur radio digital voice mode that was evolved out of the well known FDMDV software.
The mode uses OFDM with 14 carriers DQPSK and 2 pilot carriers with twice the power modulated in DBPSK.
The bandwith is 1kHz, so 2 of the signals would fit to 1 SSB channel. The datarate of the voice is 1375 Bit/s + some data bits for callsign information etc.
Its intended that in the end this mode can also be used for DX connections. Lets see what live tests will bring. On 20m obviously the frequency 14.236MHz is used as center of gravity.
For using the mode you would need either a two-soundcard PC (one for connecting a headset and one for creating the digital modulation signal) or a SDR setup with virtual soundcards.
Currently a windows beta release can be downloaded as binary. For Linux you have to download the source and compile it on your own. David created a nice Makefile that downloads and compiles all dependecies.
You find further information on the project page http://freedv.org/tiki-index.php.
Also some videos are linked that show the operation and the audio quality of this digital mode.
Yesterday i tried a bit with my HiQSDR in loopback mode. I had no live contact so far.

I have not heard anything from Helmut recently.
I still have the problem with the FDX LED on and preventing TX.

Any suggestions welcomed.
The only one I can come up with is reprogramming the FPGA with the v1.3
code which is the level it is currently programmed with.

Thanks Mario,
Helmut assured me that simple logic checks would not do the job as I was expecting not to see a floating level (+0.29V) at the CCTX end (X2-7) of R51 when there is +3.29V on the other end (X2-8).

+0.29V also at IC7-12.

752. Quisk digital filtering

Yahoo group: n2adr-sdr
Date: 2012-12-19 08:27:24 UTC
From: Mario
Topic: 752 Message: 752

Hi,

in the code of quisk i saw that the samplerate which is used for the digital filters was changed recently. In the changenotes i found that the filtering was changed in 3.6.2 in order to improve the performance with low-cpu machines.
A question especially to Jim:
Is there a possibility to get 48kSpl filters back to the code as an option in order to support audio bandwidth >6kHz again (e.g. 10/20kHz for DRM mode) ?

regards
Mario

From: jimahlstrom
Topic: 752 Message: 756

Hi,

The sample rate of the filters depends on the mode. CW filters at 6k, SSB at 12k and AM/FM at 24 ksps. This enables smaller CPUs to run quisk. I can run Quisk on an Intel Atom processor at 480 ksps.

How do you get the samples out to your DRM decoder?

Jim

757. Re: Quisk digital filtering

Yahoo group: n2adr-sdr
Date: 2012-12-23 10:26:07 UTC
From: Mario
Topic: 752 Message: 757

Hi Jim,

i used to use USB with about 15kHz Bandwidth and output of audio to alsa loopback device in the past. What makes sense is to use the DGTL mode to output the audio to DREAM. But i did not try so far if the audio from Quisk then interfers with the audio from DREAM. Think that would also need to switch off the original audio in case the external software outputs audio to the soundcard and no second one is available.
Do you think making the filter sample rate of the DGTL mode configurable makes sense ?

I wish a Merry Christmas to you and your family !

758. VNA problems

Yahoo group: n2adr-sdr
Date: 2012-12-23 21:17:08 UTC
From: zl2apv
Topic: 758 Message: 758

Hi All,

I am having problems with my HiQSDR in VNA mode. The software starts OK but when I try to do, say a transmission short calibration nothing happens.

The problem is intermittent and seems to occur after I have run Quisk. On a clean boot and first time connect to VNA it seems to work every time so far.

The problem occurs with both a network connection and a twisted ethernet cable direct connected.

The problem occurs with both Quisk_vna and Stefan DL2STG's vna software.

Starting from a terminal does not give any different error messages when in faulty mode.

Has anyone else experienced any reluctant startup of their VNA?

73 Graeme

759. Re: Quisk digital filtering

Yahoo group: n2adr-sdr
Date: 2012-12-24 15:47:53 UTC
From: jimahlstrom
Topic: 752 Message: 759

Hi Mario,

It is easy to change the DGTL sample rate to 24 ksps, but harder to get it higher, because the initial decimation is to 24 ksps. Then DGTL would be equivalent to USB at a bandwidth of 10 kHz. Is this too narrow?

An alternative is to send the I/Q (complex) samples at 24 ksps directly to DREAM instead of mono audio. That is always best for any digital mode, but there seems to be no standard way to do this. Does DREAM accept complex samples? If so, how?

Another alternative is to use the external filter option.

To decide which is best I need to know the hardware you are using, the initial samples rates, the final sample rate desired, and whether you want mono audio or I/Q samples. The reason all this is difficult is that I am using a large number of optimized filters and decimation schemes to reduce CPU usage.

Merry Christmas and best wishes for the New Year!

Jim

Hello Graeme,
culd be a problem with your browser cache.
We have complete change the server.
Before the static site was a subdomain of finken-net.de now its all redirect to this adress:
http://hiqsdr.com/hiqsdr-wiki/index.php

Please if you have no success with that please let me know.

By the way if you want then create an account and you can contribute something to the wiki itself.

Topic: 752 Message: 763

Hi Jim,

many thanks for following up this discussion.

> Then DGTL would be equivalent to USB at a bandwidth of 10 kHz. Is this too narrow?

Yes, i think its a little too narrow. The bandwidth of the DRM signal is 10kHz usually. They can also use a double channel with 20kHz bandwidth.

>
> An alternative is to send the I/Q (complex) samples at 24 ksps directly to DREAM instead of mono audio. That is always best for any digital mode, but there seems to be no standard way to do this. Does DREAM accept complex samples? If so, how?

Oh i agree. DREAM can accept IQ samples via soundcard. Currently there is no chance to get them in via Ethernet although this would be my preferred way. Output of IQ Samples to the loopback sound device would be great because then you could easily connect any software that accepts IQ samples from softrock based receivers.

>
> Another alternative is to use the external filter option.

Ah yes. I forgot about that. Thanks for reminding.

> To decide which is best I need to know the hardware you are using, the initial samples rates, the final sample rate desired, and whether you want mono audio or I/Q samples.

I currently use a HiQSDR. Input sample rates are usually 192kSpl/s or next two higher settings.
Think both options (mono and IQ are needed for different use-cases). DREAM could be very nicely used with IQ input and output and for example FreeDV can only be used with mono signals since it is made for usual SSB radios.
So could it be an option to have a checkbox (IQ / Mono) that switches between complex IO filters and Upper sideband usage ?

> The reason all this is difficult is that I am using a large number of optimized filters and decimation schemes to reduce CPU usage.

Understood. Can the filters be re-used for complex filtering ?

Regarding the IQ samples i have another question independent from the DGTL mode discussion above:
To run the HiQSDR in parallel locally and as a WebSDR it would make sense to have the chance to output the received samples directly to a sound device (loopback). For example set the hardware frontend to 192kSpl/s, receive with Quisk, output the raw samples to the loopback device and use in WebSDR as well. This would make the frontend compatible with WebSDR as well as CWSkimmer. I assume this only makes sense if the rate from the frontend is already a rate that can be used by the loopback device and the software that is

connected at the other end in order to avoid decimation.

regards
Mario

The FDX LED is on the Preselector and it is permanently on whether the interconnecting cable to the HiQSDR is attached or not so the +0.29V is not a LOW coming from the HiQDSDR FPGA pin 57 via resistor pack RN1.

HiQSDR X1 connects to Preselector X2.

X1 pin 9 (+3.29V) --> X2 pin 9 --> R51 (OK)

X1 pin 7 is not used and should float according to Helmut.

X1 pin 7 (CCTX) --> X2 pin7 --> the other end of R51 is +0.29V.

R51 is a 10K pull-up attached to +3.29V so the +0.29V is not what I would expect. It seems to be acting as a low input to IC7 and propagated to IC5 to turn FDX on.
73 ... Sid.

From: Yogy San
Topic: 768 Message: 768

Hi all,

I need to know if the FPGA is used only as a DDC/DUC.
In this case the baseband signal is sent trugh Ethernet chip to the PC where is processed.

If the DUC/DDC is the only function of the FPGA it is used the Core Genarator of ALTERA Quartus and the DDC/DUC is automaticly gennerated or the code is writed by someone ?

Regards,
Cristian.

Topic: 760 Message: 769

Hi Hubert and group,

I have looked more deeply into the connection problem and can confirm it is not a cache problem as I used a machine (my cell phone) which had never accessed the site before and it still won't connect.

I asked my daughter to try from her qth with different isp and she can connect just fine.

She then tried from her work and it failed with the Web Marshall server reporting a timed out connection or not able to connect.

At a bit of a loss what to do next. It may be tied up with robot.txt being used but I am guessing wildly. Maybe I need to add the url to my allowed list on my firewall but that seems a bit drastic.

Any suggestions please,

73 Graeme ZL2APV

Hi Cristian,
I think all your questions are answered in the pptx presentation that
can be downloaded from
http://hiqsdr.com/hiqsdr-wiki/index.php?title=HiQSDR-Presentation

There used to be a pdf version there but it seems missing. If you need
it I can email it to you.
Any lingering questions I'm sure will be answered.

Hi Graeme,
it may not be the same problem but quite some time back I could only get on to the site using opera. Both firefox and google-chrome failed.
All the browsers now work and my Galaxy S2.
73 ... Sid.

Hi Wayne and Sid,

Thanks for the help. I have installed Midori but still can't access. I did not expect to as I can not ping hiqsdr.com although I can ping hiqsdr.org just fine.

It appears that it works from some isp's and not others so the mystery deepens. I think I will contact my isp and see if they have any suggestions.

775. Domain availability

Yahoo group: n2adr-sdr
Date: 2012-12-27 21:23:56 UTC
From: Helmut Goebkes
Topic: 775 Message: 775

Hi Group Members,

we changed the Domain Hosting of all HiQSDR Domains

HiQSDR.de
HiQSDR.com
HiQSDR.org

to a new Provider with more site space and higher backbone speed.
This is done to support you with better and more powerful
HiQSDR Websites.

Due to the domain Transfers, the availability / acessability
of the above domains (and the Wiki)
can be reduced the next few days.

Currently the easiest way to access the actual HiQSDR-Wiki is
to connect it directly via the following link:

http://www.hiqsdr.com/hiqsdr-wiki/index.php

In a few days, the domain moving will be completed and the sites are normal accessible via the "plain" web addresses as usual.

Thank you to be Patient

73!

Helmut, DB1CC

Hi Helmut,
With the cable removed and the FDX LED still lit, looks like a problem
on the Preselector itself.
There is RN5 and CN3 as possible suspects for holding the other end of
R51 at +0.29V.
Any thoughts?
73 ... Sid.

Hello Graeme and group,
many thanks for testing and your comments.
Meanwhile, the domains were migrated to the new provider
so there should be no problem with the accessibility of the sites more.

779. Re: Quisk digital filtering

Yahoo group: n2adr-sdr
Date: 2012-12-30 11:05:52 UTC
From: Mario
Topic: 752 Message: 779

Hi Jim,

there were some discussions which sideband to use in digital modes below 10MHz in the FreeDV google group. I had the opinion that always USB should be used but it turned out that it could be rather inconvenient. In case you have a mixed mode QSO (for example SSTV/SSB) you might need to use LSB for digital mode because otherwise you need to switch from Digital to Analog and change the frequency as well. So this makes it more complicated. Unfortunately it seems not enough to use USB always for digital modes. Probably this could be linked to the last setting of the SSB sideband.
Hope this does not create too much headache ;)

regards
Mario

Hi Hubert,

Sorry I can't test any further as it seems my isp has blocked for some unknown reason the url. I have contacted them and asked them to allow the connection but at holiday time I have had no response. Looking forward to accessing the site.

781. Preselector partlist question

Yahoo group: n2adr-sdr
Date: 2013-01-01 17:49:56 UTC
From: Mario
Topic: 781 Message: 781

Hi,

currently i am assembling the preselector board.
D4,D5,D6 are MBRS160 in the partlist. In the schematic 12V Z-Diodes TZMC12-GS08 are mentioned. Which one is correct ?

regards
Mario

From: Dr. Karsten Schmidt
Topic: 781 Message: 782

Hi Mario,

I checked the documentation, on my version "I" I found the MBR160 in the schematics and in the partlist the MBRS160. So, I put three simple Schottky Diodes 1A, 60V on my board.

Kind regards an happy new yew

Hi Karsten,

thanks for the hint. I had also some schottky diode in my mind but the current schematic on the hiqsdr wiki states the Z diodes.
I will wait for the answer from Helmut but i guess the shottky diode is what he intended.

BTW: Did you use the both Panasonic power chockes from the partlist or did you find a replacement ? I did not find a suitable SMD 1mH chocke so far.

regards
Mario

Hi Mario,

as far as I know, I have a spare matching "Panasonic" power chokes. I will check this in a couple of minutes, but probably answer tomorrow J. You mean L1, right?

One _important_ hint:

Please think about the soldering of the relays.

For instance:

Start with Rel24 then Rel18 then Rel25 then Rel19 then Rel26 then Rel20 and so on.

Do __NOT__ solder Rel24 then Rel25 then Rel 26 . otherwise it's impossible to solder Rel19!!!!!!!!!!

Kind regards

Karsten

Hi Mario, hi members

>D4,D5,D6 are MBRS160 in the partlist. In the schematic 12V Z-Diodes >TZMC12-GS08 are mentioned. Which one is correct ?

Normally, you can use the MBRS160 types, power schottky diodes.
But Keep in mind, that if you use the schottky diode, the cathode must be in the correct direction, i.e. Cathode must on 12V power supply side.
ULN2803 has internal free wheeling diodes but for safety we have to add an external one.

The use (and the Intention why i draw them into the schematics)
of a power Zener-Diode as free wheeling diode is a Little trick of
mine. If you switching off a relay, the magnetic energy in the relay
holds the relay at the active state until the energy has dropped.
With a "normal" free wheeling Diode, the voltage is clamped to 12V suplly. If you allow stored energy to rise to higher voltages, the Switch off is faster. To limit the voltage for the free wheeling, a power Zener is used. The Zener voltage (and therefore the max. free wheeling voltage) must below the ULN2803 Limits and all connected parts, so i used a 12 Volt Zener to allow rising up to 12V+12V=24V.
But in reality, this speeding up of the relay turn-off is not
so big the it is needed here, and therefore you can use normal Schottky diodes (but Keep in mind the correct polarisation!!!)

73!
Helmut

PS Mario, Cores on the way to you!

Hi Helmut,

sorry for another question:

Preselektor L8 & L9 are marked as 470uH 0805 inductors.
Can you indicate a type ? I was not able to find 470uH in 0805 size so far. Just 1007. Or is a BLM Ferrite beat ok as well there ?

Hi Mario,

I see from the code that the digital modes always play at the radio sound play rate, but the digital input must be 48 ksps. Often the radio sound play rate is 48 ksps too, but what if it is not? It seems to me that the digital modes should always play at 48 ksps even if the radio plays sound at a different rate.

Do you think that the digital play rate and digital input (capture) rate should be fixed at 48 ksps?

What does everyone else think?

Jim

Hi Jim,

since it seems that we never play or input bandwidths >20kHz it appears that 48kHz samplerate is fine. What i do not know is if every hardware soundcard can really handle 48kHz or if some can use 41kHz only.
I think for the moment 48kHz is ok. At least i never used something different ;)

regards
Mario

792. Quisk Frequency Measurement

Yahoo group: n2adr-sdr

From: jimahlstrom
Topic: 792 Message: 792

Hello,

Quisk 3.6.5 has a feature to measure the frequency of a received signal. Right-click the S-meter window to turn it on.

I used this in the November 2012 ARRL Frequency Measuring Test with good results. First I warmed up my hardware for several hours. I measured WWV at 5 and 10 megahertz for a calibration during the test, and measured the eight frequencies on the 160, 80 and 40 meter bands. The signal on 160 was inaudible, but the software measured it anyway.

The result was an average error of 0.03 Hertz, with a maximum error of 0.22 Hertz. Not bad for a free running crystal oscillator (with maybe a little luck)!

The software design is straightforward. The signal is decimated to 6000 sps, and a 12000 point FFT results in a bin width of 0.5 Hertz. The peak bin and the two adjacent bins are interpolated to get the measured result. Results are at http://www.b4h.net/fmt/fmtresults201211.php .

On a different note, the latest QEX has an article on my VNA. The publishing lead time of QEX is about ten months.

Jim

794. Preselector construction Problem and solution

Yahoo group: n2adr-sdr
Date: 2013-01-05 07:08:03 UTC
From: zl2apv
Topic: 794 Message: 794

Hi All,

I decided to roll my own preselector as I had a lot of T37 toroid cores and a bundle of dip relays recovered from an old PABX (MR62-12usr) and I wanted an 0.75 octave filter set rather than ham-band only.

I breadboarded by soldering the relays down both sides of a piece of PCB with tracks scribed for the relay pins. The RF in contact was connected by a transmission line of RG174 with 2 mm of braid removed to correspond with each relay contact and the centre soldered to the pin. Each side of the pin the braid was soldered to the PCB earth plane.

Pieces of PCB were glued to the PCB for the toroid and capacitor interconnections and the 10 metre (a 3 pole Chebyshev mesh filter) was constructed.

Missing out the relays the filter performed as designed using the sdr vna but when it was connected via the relay chain it had a notch at about 55 MHz and the attenuation at 60 MHz was only 28 dB and trending worse as frequency rose.

I put terminating resistors on all the normally made contacts of the relays which improved the 60 MHz attenuation 3 or 4 dB but did not affect the notch at all. I then removed the resistors and hard grounded them with a tiny improvement but not worth the trouble.

Finally I bypassed with .01 uF the +ve common rail of the relay coils and it was like magic. The filter now performed similar to how it did stand alone. Adding two more bypasses along the relay chain improved things even more.

I did not expect it to be resonances from the relay coil but that was the problem. What I am suggesting is that if you use cheap non RF relays that you bypass the coil to ground. In my final board I will design it with a bypass on both the 12 V +ve and the switched negative side of the coil. A small price to pay for cheap second hand relays. Typical miserly ham :-)

795. HiQSDR VNA problem

Yahoo group: n2adr-sdr
Date: 2013-01-05 07:15:45 UTC
From: zl2apv
Topic: 795 Message: 795

Hi All,

When I first switch on my HiQSDR and run the VNA software it works flawlessly and will run indefinately (well I have run it for about 14 hours at a stretch) but if I close down the vna software and restart it it simply won't communicate with the HiQSDR.

I can start Quisk and that works fine on both Rx and Tx but until I have turned off the HiQSDR and left it for a while I can't run the vna.

It seems heat related?? with having to leave it for a while but that does not entirely stack up as the vna runs continuously once going.

It has been like this from the day I got the board and I am wondering if it is just my board or a "feature". I would certainly appreciate any help I can get.

Hi Graeme,
This may not have anything to do with the problem but I don't like components getting any hotter than I can avoid

Having made up a crude-ish aluminium case for the HiQSDR I noticed the top was getting quite warm above the FPGA so I've placed a 2" x 2" 12V DC fan run at +6V mounted on top of the case above the FPGA and I never feel any warmth from the exhaust air.

At one stage I was thinking of sticking a heatsink on to the FPGA as some of the HPSDR guys have done for the Hermes FPGA and ADC.

From: zl2apv
Topic: 795 Message: 797

Hi Sid,

I absolutely agree on the heatsink stuff. I am screwing the HiQSDR heat block to a 3 mm Al extrusion with fins screwed to it as part of the case and yes I have a cpu heat sink to go onto the fpga. Probably an overkill but I feel the same as you about cooling and my intention is to have the radio running permanently 24/7 so it needs things stacked in its favor.

The strange behaviour happens with negligible heating i.e. I can switch on and run the vna for 10 seconds or so, close down the vna and open quisk, immediately close it and start the vna and it won't work until I power off for some minutes.

If I run the vna, I seem to be able to close the software and re open it (vna only) indefinitely without a problem. It only goes wrong if I run Quisk or QtRadio in between.

So it looks like a problem with standalone qvna.

I did think of heatsinking the heat block but went for the fan instead
as it keeps all chips cool.

I have to fashion a heatsink for the MPPA though I have one from a dead
10W PA, one that was working probably 2 decades ago but when I tried it,
adjusting the bias had no effect.

800. Preselector problem

Yahoo group: n2adr-sdr
Date: 2013-01-13 23:16:14 UTC
From: Sid Boyce
Topic: 800 Message: 800

Hi Mario,
As you are building the Preselector it would be interesting to know what
the voltage readings are from R51 to GND.

I am seeing +3.29V at the X2 end and +0.29V at the other end which
causes the FDX LED to be permanently ON and that inhibits PTT from working.

I get the same even with the cable to X1 on the HiQSDR disconnected.
Thanks.
73 ... Sid.

Hi Sid,

the X2 side of R51 is connected to +3.3V at HiQSDR, so if you have connection to hiqsdr this pin must have 3.3´V, so your reading is correct.
If you disconnect HiQSDR, the voltage on X2, Pin9 is undefined, so the voltage reading is undefined or irrelevant,
so all measurments are valid with hiqsdr connected.

If you measure the other side of R51, the voltage depends on the signal level on PIN56 of FPGA.

The Input on X2, pin7 of Preselector is a hi impedance imnput and should be floating if X2 is open, because
there is no further connection (R51 is also floatin, because it is not connected to X2 Pin9.

If this pin is stuck to GND, the capacitor network CN3 (Pin8) is defective (short to GND) or IC7 is damaged.
If X2, Pin 7 is not stuck to GND, maybe the PIN56 @ FPGA is programmed to GND. THis bin have to be Hi-Impedance
(floating) or programmed HIGH (!)

To test a PIN for floating or high impedance, a normal Voltmeter is not sufficient!
Best ist to drive the pin via a resistor to 3.3V (10kOhm as example) and measure then. Now the
voltage should also nearly the 3.3V.
Best is to inspect the input with a 3.3V-compatible
CMOS Pin Tester who shows the signal level directly or use an oscilloscope.

best regards,
helmut

805. New Quisk 3.6.6

Yahoo group: n2adr-sdr
Date: 2013-01-20 01:23:05 UTC
From: jimahlstrom
Topic: 805 Message: 805

Quisk Version 3.6.6 January 2013

I corrected the frequency measurement feature so it works with RIT. This feature was successfully
verified in the November 2012 ARRL Frequency Measurement Test. I fixed a bug in Fldigi frequency
control thanks to Hubert, DG7MGY.

The config file has a new parameter mouse_wheelmod to control the mouse wheel sensitivity. Thanks to DG7MGY for the patch.

I changed the digital filters so they have a bandwidth up to 20 ksps. This accommodates more digital modes.
There are now three digital modes: DGT-U and DGT-L decode the audio as upper or lower sideband. The old
DGTL mode is now DGT-U. The mode DGT-IQ does not decode. It sends the I/Q samples directly to the
sound card device. It is interesting to listen to the DGT-IQ signal, as it provides binaural reception.
Also, the PTT can be controlled by either Quisk or Fldigi, not just by Quisk.

There is a new tab on the Config screen where you can enter the frequencies and modes for favorite
stations. This can be used to list and tune to repeaters or nets. The page works like a spreadsheet.
Fill in the rows with an arbitrary name, the frequency as integer Hertz or decimal megahertz, the mode and
an arbitrary description. Right click on the left row label for a popup menu that allows you tune to that
row. Thanks to Brian KF7WPK for suggesting this feature.

Sounds super !!!!

Has anyone asked about what it would take to get Quisk to run on an Arm7(quad core) ?

Subject: [n2adr-sdr] New Quisk 3.6.6

Quisk Version 3.6.6 January 2013

I corrected the frequency measurement feature so it works with RIT. This feature was successfully

verified in the November 2012 ARRL Frequency Measurement Test. I fixed a bug in Fldigi frequency

control thanks to Hubert, DG7MGY.

The config file has a new parameter mouse_wheelmod to control the mouse wheel

sensitivity. Thanks to DG7MGY for the patch.

I changed the digital filters so they have a bandwidth up to 20 ksps. This accommodates more digital modes.

There are now three digital modes: DGT-U and DGT-L decode the audio as upper or lower sideband. The old

DGTL mode is now DGT-U. The mode DGT-IQ does not decode. It sends the I/Q samples directly to the

sound card device. It is interesting to listen to the DGT-IQ signal, as it provides binaural reception.

Also, the PTT can be controlled by either Quisk or Fldigi, not just by Quisk.

There is a new tab on the Config screen where you can enter the frequencies and modes for favorite

stations. This can be used to list and tune to repeaters or nets. The page works like a spreadsheet.

Fill in the rows with an arbitrary name, the frequency as integer Hertz or decimal megahertz, the mode and

an arbitrary description. Right click on the left row label for a popup menu that allows you tune to that

row. Thanks to Brian KF7WPK for suggesting this feature.

Hi Mike,
My experience with quisk and ODROID-X.

Jim suggested video handling is the resource hog.

I installed the mali400 driver from the repository but it failed to work, mali400_dri missing.
I also had a brief look at building the mali400 driver from source, no luck there.

From the Ubuntu repository.

So .. the wait is on for Samsung to release a SDK for the Mali400 Quad core ....

Sucks that their is a 433Mhz Quad GPU that's basically useless at the moment ....

i probably would of bought a cheap dual/quad intel/AMD from the bay with a good internal soundcard if i knew i would wait a year for a video driver from Samsung.

Quisk is still my Fav ubuntu software ....

Some Progress, changed quisk.py

from

bmp = wx.BitmapFromBuffer(len(row) / 3, 1, row)

To

bmp = wx.BitmapFromBufferRGBA(len(row) / 4, 1, row)

That's the display problem fixed - but graph and waterfall
very jerky.

Getting blotches of sound heavily modulated by what
sounds like horses trotting even at 48K samplerate while
there is no problem with QtRadio at 480K samplerate
probably because quisk is mainly written in python and ARM
seems not to be able to handle it, even with a Quad core
1.4GHz CPU, 1G of memory and 3G of swap.

73 ... Sid.

On 19/11/12 12:52, Sid Boyce wrote:

Hi Mario,

The ODROID-X is a quad core ARM A9 embedded board.

It is running Ubuntu 12.10 so I'll post a query to the
odroid and Ubuntu ARM forums.

The different levels for 12.10 on each:-

ARM

---

ii python-wxgtk2.8
2.8.12.1-6ubuntu2

x86_64

---

ii python-wxgtk2.8
2.8.12.1-11ubuntu3

There could be differences between the source from
which each was built.

73 ... Sid.

On 19/11/12 07:19, Mario wrote:

Hi Sid,

from the trace i think thats a problem with

Corporations are not known for being that reactive.
Moments ago on the google-earth forum a guy posted he was having a
problem on Fedora 17 just like the one reported on openSUSE.

All it would take is a recompile with a different library but it has
been at least 4 weeks with no resolution.

The attraction of the ODROID-X is the size/performance ratio.

The code is out there but seems incomplete.

810. Re: New Quisk 3.6.6

Yahoo group: n2adr-sdr
Date: 2013-01-20 19:09:08 UTC
From: Mario
Topic: 805 Message: 810

Hi Jim,

many thanks for the new release !
I had no time to try in detail so far. Just noticed one thing.
Could you add selection of the correct wx version to one of the future version of quisk ?
On my Ubuntu Laptop i had to add

```
import wxversion
wxversion.select('2.8')
```

to quisk.py before the line that imports wx.

Many many thanks for adding the DTLIQ output mode ! Thats really a helpful feature.

regards
Mario

Hello Jim,
also from me many thanks for this new version.
Today Herbert DG3MDE have tested it with Windows and Fldigi
on my linux system it works also well in digitalmode and Fldigi.

813. Re: [n2adr-sdr] Preselector problem

Yahoo group: n2adr-sdr
Date: 2013-01-21 19:27:53 UTC
From: Sid Boyce
Topic: 800 Message: 813

Hi Helmut,
HP 1725A Scope measurements with 10x probe 0.1V range DC. Ribbon cable connected between HiQSDR and Preselector.
R51/X2-pin 9 +3.3V

R51/X2-pin7 +0.3V

U7-12 +0.3V

U7-8 0V

U7-1/19 0V

U7-20 +4.5V

+3.3V --> 10K --> U7-12 (+0.5V) and FDX LED still on.

+3.3V --> 10K --> U7-12 with ribbon cable disconnected FDX LED still on.

Resistance U7-12 to GND 898 ohms with power off of course.

I have some 74HCT245M chips from RS Components if you agree U7 is most likely.

73 ... Sid.

814. Re: Preselector problem

Yahoo group: n2adr-sdr
Date: 2013-01-25 07:57:44 UTC
From: Mario
Topic: 800 Message: 814

Hi Sid,

yesterday evening i had some time to try the preselector board.
I see a similar problem than Sid with my board but probably it has a different cause.

I just plugged the filter boards which do not have toroids assembled yet. I just want to see which bandfilter module is selected.
The bandfilters are switching fine out of quisk as well as teh preamplifier LED.
The FDX LED is always on. No switching if i press FDX or PTT.

This morning i debugged a bit further.
If i disconnect the cable towards the Hiqsdr i see that i can switch the FDX function on and of by pulling the CCTX signal 3.3V and GND.
Low means FDX=on, 3.3V means FDX=off as far as i understand.
This lets me assume that the Preselector is working properly.

Then i checked the state of CCTX on the frontend board with the Preselector disconnected.
It seems that the pin is always driving low (or pulled low) regardless what setting i use for FDX in QUISK.
In difference to the preselector pins were i read really 0V in Low state i see around 50mV at the CCTX pin. But if i try to pull the pin up via 1kOhm thats not working.

Finally this lets me assume that i either have a problem with the FPGA pin (which is unlikely since all the others are working properly) or i have some difference in the FPGA image. (i think i use 1.3-sg).

Next step would be to investigate why the CCTX pin is always in that state.

regards
Mario

815. Re: [n2adr-sdr] Re: Preselector problem

Yahoo group: n2adr-sdr
Date: 2013-01-25 12:04:54 UTC
From: Sid Boyce
Topic: 800 Message: 815

I am using fpga_ver3-sg1.1.tgz.

In my case disconnecting the cable and applying +3.3V via 10K to U7 pin 12 does not turn off the FDX LED.

This suggests that there is either a faulty Preselector U7, RN5 or CN3.

With power off U7-12 to GND measures 898 ohms but there may be a component breakdown when power is applied.

Band switching works fine.

At the moment using QtRadio there is a separate panel for band switching and the nice thing about that is the ability to see the excellent effect of having a filter switched in for one band with a different band selected in QtRadio.
However, automatic switching of filters with band selection has been discussed and no doubt Graeme is beavering away at it.
73 ... Sid.

From: zl2apv
Topic: 800 Message: 816

The auto switching is on the back-burner for a little while longer as I get my preselector finished. I should be started on it in the next week or two and have had a preliminary look at the code and see that Andrea has already done so much and obviously looked to the future to make it easy to hook in auto switching. I have followed your problems with the preselector but am not able to help as I am rolling my own.

Topic: 800 Message: 817

Thanks Graeme,
I know you are rolling your own.
As it appears to be a component on the Preselector, I'll get to it.

Doing some calculations this evening +3.3V through 10K in series with 1K (898 ohms), at the junction of the 2 resistors and U7-12 is ~+0.3V which is what I am seeing.

As I have the IC, replacing U7 will be the easiest place to start.
If that's not it, I'll have to get replacements for RN5 and CN3.
73 ... Sid.

From: Mario
Topic: 800 Message: 818

Hi Sid,

i agree. If you cannot switch the FDX function by pulling the CCTX signal manually there must be a defect in your hardware.
You should go ahead there. I will meanwhile investigate whats going on in the frontend and why the CCTX signal is pulled low although in the FPGA pin configuration its set to input with weak pullup.

regards
Mario

From: Sid Boyce
Topic: 800 Message: 819

Thanks Mario,
The first thing I'll do before changing U7 is to lift pin 12 to see if
the resistance across CN3 is much higher than 898 ohms.
73 ... Sid.

820. update: qsdr and fpga

Yahoo group: n2adr-sdr
Date: 2013-01-27 18:12:04 UTC
From: dl2stg
Topic: 820 Message: 820

Hi

after a long time there is an update for the fpga, gr-hiqsdr and qsdr.

For some experiments with width band modulation i have modified the fpga-image for support sample rates from 9600 up to 3840000. The higher rates are only available with 16 or 8 bit data width. This is a limitation of the 100Mbit network.

qsdr 0.9.9 is available with the following changes:

- Internal structure redesigned
- Reduced cpu consumption
- New concept for settings
- Second rx
- OsmoSDR supported
- WFM-stereo support with RDS
- DAB+ support (not ready)
- IQ-output to Soundcard
- Gnuradio 3.6.x
- Preselector support (untested)
- new RX-Samplerates up to 1920000 (16Bit) and 3860000 (8Bit) with new fpga

Is should run out of the box in Ubuntu 12.10, no need to translate gnuradio. Packages for 32 bit and 64 bit are available at http://dl2stg.de/stefan/hiqsdr/qsdr.html

Hi Stefan,

sounds really interesting. The wideband stuff could be interesting for some experiments with DAB, DRM+ and such stuff.
What does the GR-DAB stuff exactly ? Is it just about synchronizing to a DAB signal or also DAB & DAB+ audio decoding ?
So far i did not see a AAC+ decoder suitable for DAB+ freely available.
When i fixed my issue with the CCTX signal i will try that.

regards
Mario

Hi Mario,

the gr-dab package is fully functional with DAB+ (not with DAB!) and play the audio. I use the current libfaad to decode nearly all channels. In the patch directory is a file libfaad2-2.7.patch to make the data stream elements accessible from libfaad to decode data informations like radiotext. Only for some channels with 32k audiorate a resampling module to 48k is not yet integrated. The combine.py select the channel and decode the audio, the rx frequency is very critical for sync. As next step i will integrate the stuff in qsdr.

73
Stefan

libfaad2-2.7.patch

Hi Stefan,
Thanks for the upgrade stuff.
I had been trying to convert qsdr-0.9.5 for Qt5 but not completely succeeding so I'll try with 0.9.9b1.

gr-dab I'll have a look at as I've been studying your gr-hiqsdr after watching the gnuradio presentations at
http://arvideonews.com/hrn/HRN_Episode_0051.html
73 ... Sid.

The resistance with U7 removed was still ~898 ohms.
Replacing U7 didn't solve my problem so RN5 or CN3 are suspects.
73 ... Sid.

I wonder what version of altera is recommended or successfuly used with
the latest firmware.

I have 11.0 which I used up to fpga_ver2-sg1.
11.1 didn't see the HiQSDR and I now have 12.0sp2 and 12.1 that I
recently downloaded.

The reason I ask is that the HPSDR group recommend version 12.1, the one
they used to develop the firmware.
73 ... Sid.

Hi Stefan,

sounds interesting. Thanks for the tip. I just have in mind that the DAB+ uses a different frame structure than DRM-AAC+ and therefore it did not work in the past. Would also be interesting for the DRM/DAB/DRM+ receiver software of Michael Feilen.

The frequency offset might be critical because the carrier distance of DAB Mode1 is 1kHz only. Usually this is compensated by a loop that tunes the frontend with the frequency offset estimation from the demodulator chain.

To my opinion the DAB phy is quite interesting for hamradio in terms of stability and flexibility. For audio purpose it might not make too much sense but i think into direction of video transmissions in the 70cm band. You might fill almost any video codec into a subchannel. The 1.5MHz bandwidth fits to the band and Mode2 is also suitable for 23cm and 13cm (Of cause DVB-S can be used there as well). But overall thats a different topic ;)

regards
Mario

827. Re: [n2adr-sdr] update: qsdr and fpga

Topic: 820 Message: 827

```
Updated this morning using 12.1, only one issue where it was initially
looking for Transceiver.pof in /home/stefan/projekte/sdr/Transceiver/
which doesn't exist:-
slipstream:/HAMRADIO/SDR/N2ADR/FPGA_V3-SG2/Transceiver # ls -l
Transceiver.cdf
-rwxr-xr-x 1 1003 1007 335 Jan 20 18:37 Transceiver.cdf
slipstream:/HAMRADIO/SDR/N2ADR/FPGA_V3-SG2/Transceiver # ls -l
Transceiver.pof
-rw-r--r-- 1 1003 1007 2097357 Jan 20 18:38 Transceiver.pof

The command line is mightier than the GUI.
slipstream:/HAMRADIO/SDR/N2ADR/FPGA_V3-SG2/Transceiver #
/home/lancelot/altera/12.1/qprogrammer/bin/quartus_pgm -c USB-Blaster
Transceiver.cdf
Warning (11655): Can't locate programming file Transceiver.pof in
/home/stefan/projekte/sdr/Transceiver/. Found and loaded programming
file Transceiver.pof from the current Chain Description File directory

I used also altera version 12.1 for translating. FPGA_V3_SG1 and older make some trouble with timing in 12.1.

Hi Mario,

i use the carrier phase to lock the frequency against drift of the USB-Stick. The raw lock is not yet realized and made my hand.

For transmitting with a bandwidth of 1.5Mhz some changes in the fpga are necessary. This is not a so easy but interesting task. For rx, i use a internal doubled clock of 245 Mhz for the last FIR-Filter to preserve 460 tabs at a samplerate of 3840000. This is a near the borderline off fpga timing and not meet all considerations.

regards
Stefan

From: Sid Boyce
Topic: 831 Message: 831

FASDR has now claimed 15.
#define RIG_MODEL_HIQSDR RIG_MAKE_MODEL(RIG_KIT, 14) /* HiQSDR */
#define RIG_MODEL_FASDR RIG_MAKE_MODEL(RIG_KIT,15) /* Funkamateur Sdr */

Jim,
I think the hamlib patch with a different rig number is good enough to
go upstream even as a place holder.

Hello,

I don't mind putting the Hamlib patch in for the hardware. But I don't think that Hamlib should connect to the hardware, I think it should connect to the software. The software can always use rig 2. See

http://james.ahlstrom.name/hamlib.html.

Hi Jim,

i think the Hamlib stuff is still useful for sofware that wants to use the samples from the frontend directly and do not want to care so much about controlling it.

regards
Mario

835. Re: Preselector problem

Yahoo group: n2adr-sdr
Date: 2013-01-31 10:32:52 UTC
From: Mario
Topic: 800 Message: 835

Some further investigations from my side so far:

Bypass:
I noticed that the assembly print of the preselector has a slight chance to be missunderstood.
R43 / D1 prints on the board are aligned in a way that made me swap the pads and therefore assemble D1 in the wrong direction. That was the reason why i did not notice that the bypass setting works well although the LED was always off.
In addition the solder jumper setting for selecting BU3 (PA path) is 2-3 for the filter modules but 1-2 for the bypass path. I did this wrong as well because i did not read the comments ;)

FDX:
I now know that pins that are not assigned to a signal in the FPGA may not have the default direction that is assigned in the CDF file. This means that the CCTX pin on my board was stuck at 0 although in the CDF file it was specified with "input with weak pullup". I made a signal CCTX in transceiver.v and assigned 1. This signal i connected to the CCTX pin. Now the level is always high. Unfortunately it does not work 100% still because the high level (even without any cable connected to the FPGA board) is just 2.8V. This is not enough to switch the 74HCT245 stable. If i tip the pin at the 74HCT245 i usually get over the trip level of the input and the relays switch. So the circuit seems to be ok. Even if i switch static or disconnect the CCTX signal it works well (FDX = off and RX/TX switching works) I will continue to search why this happens. Most probably the supply for that pin comes from a domain which is currently not supplied with 3.3V.
Probably i switch the pin defined to input or i find a way to switch it to 3.3V output level.

regards
Mario

Hello,

Yes, I can see that. I have no objection to the frontend Hambib rig package, and it is a good idea. But I don't know who wrote it, and I am not in a position to say when to publish it. That is all I meant.

Thanks Mario,
Keep me posted as I still have the problem, even with +3.3V through 10K to U7 pin 12 the FDX LED was still on.
73 ... Sid.

From: Mario
Topic: 800 Message: 838

Hi Sid,

i also did not find the solution but i assume the problem at your side is slightly different.
If i disconnect the FPGA board and touch the Pin7 of the header at the Preselector with +3.3V / 0V i can get the relais switching correctly. I also got the FPGA switch the pin to high level but i did not find the reason why its just 2.8V level. All the settings in the Quartus Studio appear to be correct so far. The bank IO voltage pin is supplied by 3.3V and the pin is set to 3.3V LVCMOS.
For the moment i think about just disconnecting the CCTX line in hardware for the moment ;)

Regarding your problem:
Could you try switching the signals with static 3.3V / 0V levels as well to search for the exact position were it does not work ?
If the HCT245 is working properly you should see the HCT04 and afterwards the NAND gate switching. Somewhere there must be the fault.
You could also try to lift the corresponding pin of the HCT04 and apply a static high via pullup.

regards
Mario

Thanks Mario,
I shall try troubleshooting from the output of U7 as that would tell whether the problem is with CN3/RN5 at the input pin 12 or if output Pin 7 is being dragged down.
73 ... Sid.

From: Mario
Topic: 800 Message: 840

Hi Sid,

after my attempt to set the CCTX signal to high was not that successfull i tried to set it to input in order to use the pullup towards 3.3V correctly. Unfortunately the signal was now always low again. So i started my last chance and disconnected the trace close to RN1 on the FPGA board. Now the pullup works and the the FDX function is switched off. I currently do not understand why both things (switching CCTX output high, and switching CCTX to input) do not work. But so far the problem has a workaround for me at this time.

regards
Mario

Hi Mario,
Was that done by just cutting the trace and the pullup achieved by R51 on the Preselector board?

In my case I had the same problem removing the cable and pulling up U7 pin 12 with a 10K to +3.3V. Now I'm thinking - If the cable was removed there wouldn't be +3.3V was coming from the HiQSDR to X2 pin 9 and I am fairly certain I didn't check R51 at the X2 end for +3.3V with the cable removed.

You could be on to the problem there. I'll check it out tomorrow.
73 ... Sid.

Hi Mario, Hi Sid,

i have also made a firmware with a high programmed CCTX-Line to test with and it works without problems. The definition of Pins in Quartus is a little bit tricky, notonly must the direction and pins defined, also the used logic family and levels have do be defined, so the chance to make it wrong are great
I will talk with Jim and Stefan to set CCTX as output programmed high for the next Firmware update.

#Mario, 2.8Volt @ input of HCT245 is enough to switch to high, logic hi level of HCT245 is >=2.4 Volt.

@Sid: if it helps, you can send the preselector to me to check and repair it, no problem.

73!

Helmut, DB1CC

Helmut,

thanks for crosschecking.
Which version of Quartus Studio did you use ?

> the direction and pins defined, also the used logic family and levels have do be defined,

I have set to 3.3V LVCMOS with normal drive strength.

> #Mario, 2.8Volt @ input of HCT245 is enough to switch to high, logic hi level of HCT245 is >=2.4 Volt.

I was assuming that. Most probably i have overseen something here. I just do not know what ;) What i am also wondering is why the signal is still low although i have the pullup connected and the pin switched to input. Probably the 10kOhm is a bit too large depending on the leakage of the pin of the FPGA ? With the FPGA pin disconnected on the FPGA side of RN1 it works. So it must be some current going into the pin. Either i have damaged something in the FPGA output cell or its some leakage current.
I will need to compare the levels with my second setup. But there i have to fix the voltage supply first.

I think for the moment i will proceed with the filters and assembly and return to this topic later.

regards
Mario

Thanks Helmut,
I'll wait for the firmware fix and if there is still a problem, I'll
take up your offer to fix it.

845. Auto bandswitching now on QtRadio

Yahoo group: n2adr-sdr
Date: 2013-02-06 04:11:33 UTC
From: Graeme
Topic: 845 Message: 845

Hi All,

I have added an automatic band switch facility to QtRadio which some of you may be using. I would be grateful if you could update to the latest master and test to see if it works for you.

I accidentally pushed the work and now master contains some untested code which is not good. I can't test it myself as I have no preselector and don't even have a 10 pin plug to get some flying leads into the HiQSDR board and am reluctant to force wires into the socket.

The filters don't reflect their position into the hardware panel associated with QtRadio yet but the switching will occur (I hope). There is a README_GJ to explain how the hiqsdr.conf is now set up.

73 Graeme ZL2APV

Hello Graeme ZL2APV,
i have running QtRadio master branch with your automatic band switch.
Feel free to test it look for DG7MGY at Quick Server List most of the time my dspserver is running.

QtRadio i not bad but often my dspserver was killed from glSDR users,
TX is not working and the installation of ghpsdr its not easy.
QtRadio use the new QT5 lib and an old libfftw3 also the setup of
dspserver.conf and ssl was difficult.

QtRadio is a realy good concept, receiving runs well.
But QtRadio need some improvements to control glSDR users, transmitting and connection to digitalmode software.
I like to share my HiQSDR but when I have time I would like to even have my own transceiver.

I have add some remarks about dspserver.conf and ssl
to the HiQSDR Wiki.

For working on the hambands i use Quisk, the other time are
running QtRadio to share my HiQSDR.

Thanks for adding the special HiQSDR Code to QtRadio.

73 de DG7MGY Hubert
Hardware: HiQSDR, Preselector and 10W MPPA. Antenna: Windom 80-10m

Hi Hubert,
Thanks for sharing your experience.

I did find setting up dspserver.conf for ssl was a problem.
There is quite a lot to do initially to get ghpsdr3-alex working but
once set up there is no problem.

With dspserver exiting that has not happened to me since using the
dsploop script.

```
----------------------- CUT ----------------------------------
#!/bin/sh
while [ 1 ]
do
dspserver --share --lo 0 --nocorrectiq
sleep 5
done
---------------------- CUT ----------------------------------
```

The MASTER button is also excellent in taking control from a number of
nuisance glSDR users who know nothing of the ham bands or what a signal
is and who as master will park the rig in open space, on a MW broadcast
station, selecting AM, FM or the wrong sideband in the SSB portion of
the bands or even select VHF/UHF frequencies.
73 ... Sid.

Hello Sid,
thats right it is a good temprary solution.

QtRadio make great steps and from week to week they
do a lot of work. If you have experience with Linux
now you have no problem to compile and run QtRadio.
As new User and the different libs its not so easy
to handle it, if you follow the ghpsdr3-alex wiki
now you got it.

For me it is important QtRadio to got transmit function
to work in ssb and digital mode.

Of course you need TX which I have not been able to try as I am having a problem with the FDX LED permanently on that looks like the same problem Mario is having.

Helmut has promised a FPGA update to pull Pin 57 High. If that fixes it, AOK, if not I'll send it for him to repair.

I am seeing +3.29V on the X2 end of R51 and +0.29V only on the other end of R51.

850. Re: update: qsdr and fpga

Yahoo group: n2adr-sdr
Date: 2013-02-10 21:47:25 UTC
From: dl2stg
Topic: 820 Message: 850

Hi,

i have made a new update for the FPGA. The transmitter now supports samplerates 48k, 192k, 480k and 960k. It is nice to record the full 80m band with gnuradio and transmit it later again or made some experiments with wideband modulations. Please update gr-hisdr to use the new feature. The image is compatible to the old one and older software should run without changes.

QSdr has also a update: 8 (or more, it is a #define) independent VFOs and some fixes.

Hi Hubert,

I am glad my changes to hiqsdr server in QtRadio were useful for you. I also miss not being able to transmit and you can be sure that the facility will be added in the near future. I am a very new C++ programmer and not experienced so I take much longer than the experts to get things going and it is likely that someone else will get transmit going before me. I use glsdr from my cell phone and of course not being able to switch the filters automatically was a big problem. I still have more work to finish the auto switching like seeing the filter change reflected back into QtRadio's panel and a utility to enter the filter corners so it will write your .cfg file.

More to come in the future.

Great work so far Graeme.
By removing the 60M in hiqsdr.cfg and sliding down the filter numbers so that 40m is filter 3 instead of 4, etc.etc. works fine.
73 ... Sid.

Hi Sid,

As my HiQSDR preselector is under construction and will not use the same filter set as the official preselector I am unable to do the testing myself and am very grateful to you and Hubert for your reports. I will be very pleased when your preselector problems are sorted even if it is because you are a very good test bed but limited at present hi hi.

Now that I know there is no 60 M filters I have altered the subroutine which creates the .cfg file to use the filter numbers as you have done Sid and will push them soon.

I would like to get the corner frequencies of the standard filters or see a set of curves for them so that I can use the actual frequencies to switch in the filters rather than the band edges allocated to ZL which is pretty close to the rest of the world. If anyone has the curves or corner frequencies could you please upload them to the "files" section of the list as I am sure they will be of interest to others.

Hi Graeme,
I can't TX at present so I have no BPF measurements.
I don't know if you still have problems accessing the site.
---
http://hiqsdr.com/hiqsdr-wiki/index.php?title=Preselector-Filter-Module
HiQSDR Preselector Filter Module

Band Filter Module
The filter modules are built on a precutted PCB panel, which can be
broken out and plugged into the HiQSDR-Module after assembling.
The module connectors holds also control signals and supply voltages to
allow active filters and active parts like transverters a.s.o. to built
on the filter modules.
The filter modules contains three or five pole filter structures
designed for minimal loss in passband and maximal damping outside the
band. The filter structures are designed in the lower bands as 3-pole
Chebyshev with a tapped middle coil that allows to spare one core per
filter.
The bandwith of each filter is selected that minimum loss and minimum
ripple are reached together with maximum attenuation of out-of-band
signals. The critical low bands are specially designed: the 160m-module
is a 5-pole chebyshev filter in tubular construction with ripple less
than 1dB and a bandwidth of only 250kHz.
The attenuation of signals outside the passband is more than 60dB at a
offset of 300kHz.
The other two critical bands 40m and 80m has two different modules
available at the filter panel:
One is designed as 3-pole Chebyshev-filter for minimal loss within the
passband (< 0.3dB) and as 3-pole Cauer-filter with controlled stop-bands
at the lower and higher neighbor bands (< -60dB) to be contest proof but
has slightly higher passband damping.
All filter calculations are done with the professional Filter design
program "Filter Solutions 2012" from NUSOFT and verified and simulated
with the AAA-Filter designer and practically tested with a HP 8752A
Network analyser.
The match between theory and pratical filter behaviour was nearly 99% (!)
In the following pictures you see the typical filter curve of the
30m-Bandpass filter of the 3-pole Chebyshev filter module.

Hi Sid,

Yes I am aware of the problem you and Mario have and will be very pleased when it is resolved.

I can access the hiqsdr.com site via a tunnel but have to suffer a lot of advertisements to use it. I would like the exact curves of the filters, as for example on 80M I switch from the through filter at 3.5 MHz to the 80M filter and at 4.0 MHz I switch back to the through filter. If I knew that the filter had its edges at say 3.4 and 4.1 MHz then I would alter the default setting for this.

73 Graeme

There is only the one for 40m at the URL I gave.
I don't know if Helmut has others that he has not published.
73 ... Sid.

857. Re: Auto bandswitching now on QtRadio

Yahoo group: n2adr-sdr
Date: 2013-02-13 06:25:45 UTC
From: Hubert
Topic: 845 Message: 857

Hello Grame and Sid,
my filter board setup with the bandedges.

Bank 0 Bypass
Bank 1 160m : 1800000 - 2000000
Bank 2 80m : 3500000 - 3800000
Bank 3 40m : 7000000 - 7200000
Bank 4 30m : 100000 - 10150000
Bank 5 20m : 14000000 - 14350000
Bank 6 17m : 18068000 - 18168000
Bank 7 15m : 21000000 - 21450000
Bank 8 12m : 24890000 - 24990000
Bank 9 10m : 28000000 - 29700000
Bank 10 6m : 50000000 - 54000000
Bank 11 40Xm : 7000000 - 7200000
Bank 12 80Xm : 3500000 - 38000000

80X and 40X are special filters.

We have some filter simulations done with QucsStudio,
i will put these Files as PDF to www.hiqsdr.org.

>
> I can access the hiqsdr.com site via a tunnel but have to suffer a lot of advertisements to use it. I would like the exact curves of the filters, as for example on 80M I switch from the through filter at 3.5 MHz to the 80M filter and at 4.0 MHz I switch back to the through filter. If I knew that the filter had its edges at say 3.4 and 4.1 MHz then I would alter the default setting for this.

858. Re: Auto bandswitching now on QtRadio

Yahoo group: n2adr-sdr
Date: 2013-02-14 03:34:44 UTC
From: Graeme
Topic: 845 Message: 858

Hi Hubert,

Thanks for the information. I will make the default filters to match your set except the bank 11 and bank 12 filters will need something to select them rather than the bank 2 and 3 when you want "contest filters". I will wait until you post your .pdf with the passband plots and finish the job then.

Danke sehr,

Graeme

Topic: 732 Message: 859

Hi Mario,
I have the mali400 drivers installed on the ODROID-X (ARM) and included the 2 lines for wx 2.8 in quisk.py.
I get the same errors whether I have
"bmp = wx.BitmapFromBuffer(len(row) / 3, 1, row)" which used to cure the errors or
"bmp = wx.BitmapFromBuffer(len(row) / 4, 1, row)" which used to exhibit the same problem.

The difference I now get no waterfall or spectrum.
If I click on waterfall I get the graph.
Obviously something in the mali400 driver has caused that to happen.

However I get good sound now but there are white noise pulses.
I don't know if you can spot anything - long shot I know.

File "quisk.py", line 1474, in OnGraphData
bmp = wx.BitmapFromBuffer(len(row) / 3, 1, row)
File "/usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/_gdi.py", line 856, in BitmapFromBuffer
return _gdi_._BitmapFromBuffer(width, height, dataBuffer)
RuntimeError: Failed to gain raw access to bitmap data.
Traceback (most recent call last):
File "/usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/_core.py", line 14665, in <lambda>
lambda event: event.callable(*event.args, **event.kw))
File "quisk.py", line 3314, in OnReadSound
self.screen.OnGraphData(data) # Send message to draw new data
File "quisk.py", line 1533, in OnGraphData
self.pane2.OnGraphData(data)
File "quisk.py", line 1563, in OnGraphData
self.display.OnGraphData(data[i1:i2], self.y_zero, self.y_scale)
File "quisk.py", line 1474, in OnGraphData
bmp = wx.BitmapFromBuffer(len(row) / 3, 1, row)
File "/usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/_gdi.py", line 856, in BitmapFromBuffer
return _gdi_._BitmapFromBuffer(width, height, dataBuffer)
RuntimeError: Failed to gain raw access to bitmap data.
73 ... Sid.

Hi Sid,

seems the problem you have is different from selecting the correct WxGTK version on my system.
Your problem seems to be somehow specific on the ARM platform.
I think it did also not work without these two lines, correct ?

regards
Mario

With or without the 2 lines it works exactly the same.
Previously it worked with
"bmp = wx.BitmapFromBuffer(len(row) / 3, 1, row)"
as ARM is said not to be capable of 32 bpp

I'll try an opengl branch as QtRadio may benefit from fully using the
mali400 driver.
dpkg -S /usr/lib/libGLESv2.so.2.0
mali400: /usr/lib/libGLESv2.so.2.0
73 ... Sid.

Topic: 845 Message: 862

Hello Graeme,
did you have seen the filter plots from Helmut?
http://groups.yahoo.com/group/n2adr-sdr-deutsch/files/DB1CC/HiQSDR%20Preselektor/HiQSDR%20Preselektor%20Filter/

I will draw the filters this weekend with QucsStudio from
DD6UM Michael Margraf
http://www.mydarc.de/dd6um/QucsStudio/qucsstudio.html

As next upload the files to the hiqsdr wiki as pdf and as
QucsStudio files now it is easy to simulate the filter.

Now my hiqsdr.cfg with bandedges

```
#
# HiQSDR preselector configuration file template
#
0!0!FILTER BYPASS
1!1800000!160 M
0!2000000!FILTER BYPASS
2!3500000!80 M
0!3800000!FILTER BYPASS
3!7000000!40 M
0!7200000!FILTER BYPASS
4!10100000!30M
0!10150000!FILTER BYPASS
5!14000000!20 M
0!14350000!FILTER BYPASS
6!18068000!17 M
0!18168000!FILTER BYPASS
7!21000000!15 M
0!21450000!FILTER BYPASS
8!24890000!12 M
0!24990000!FILTER BYPASS
9!28000000!10 M
0!29700000!FILTER BYPASS
10!50000000!6 M
0!54000000!FILTER BYPASS
11!7000000!6 M
0!7200000!FILTER BYPASS
12!3500000!6 M
0!3800000!FILTER BYPASS
```

QtRadio works well with this setup.

Best regards
73 de DG7MGY Hubert

I will make the default filters to match your set except the bank 11 and bank 12 filters will need something to select them rather than the bank 2 and 3 when you want "contest filters". I will wait until you post your .pdf with the passband plots and finish the job then.

I would like the exact curves of the filters, as for example on 80M I switch from the through filter at 3.5 MHz to the 80M filter and at 4.0 MHz I switch back to the through filter. If I knew that the filter had its edges at say 3.4 and 4.1 MHz then I would alter the default setting for this.

Hi Jim,

yesterday evening i tried to get your Rfgain function working here but was not successful. I copied the section with the rfgain from your quisk_hardware.py and also inserted the call for the function. Unfortunately i seem to miss something and it had no effect. Or do i have to type "make" again before it takes effect ?

Another thing i tried was to get DRM reception operational again.
Unfortunately the current version of Dream does not work with alsa but just with pulseaudio. So i tried to send the digital audio to pulse but if i start Quisk then it immediately stops operation.
I changed back to alsa loopback and tried to send the normal audio via pulse and that worked. Now i was able to attach Dream to the normal audio and was able to receive DRM. I just had to output the audio of Dream to a different audio port.
Its just not clear to me why the audio stops if i try to output digital audio to pulse.

One minor thing: Is it possible to make the Mute button just to have impact on the normal audio output and not on the digital audio ?
Sometimes i just do not want to hear the digital signals ;)

Overall quisk works really nice ! Many thanks !

regards
Mario

Hi Mario,
I have not looked at the digital side of quisk but I always run make
after any changes to other than ~/.quisk_conf.py.
73 ... Sid.

I guess you mean the RF Gain button. The code from n2adr/quisk_hardware.py will not work unless you have my hardware (you don't). If you have the HiQSDR, you don't need to do anything because the code is built in. If you have different hardware, you need to write your own control code for RF Gain.

> Its just not clear to me why the audio stops if i try to output digital audio to pulse.

I don't have pulse audio, and I can't help here. Quisk outputs samples to a fake sound card that most software can connect to. I wish there was a standard way to connect samples to another program, but there is not.

> One minor thing: Is it possible to make the Mute button just to have impact on the normal audio output and not on the digital audio ?

This will be fixed in the next release, due out shortly now that I am back from a ski trip to Park City, Utah.

Hello Graeme,
i put the simulated filter plots to the HiQSDR wiki.
http://hiqsdr.com/hiqsdr-wiki/index.php?title=Preselector-Filter-Curve

The plots are made with QucsStudio, i will put the QucsStudio
files also to the wiki. Now you are able to set the markers to your intresting point.

I would like the exact curves of the filters, as for example on 80M I switch from the through filter at 3.5 MHz to the 80M filter and at 4.0 MHz I switch back to the through filter. If I knew that the filter had its edges at say 3.4 and 4.1 MHz then I would alter the default setting for this.

Topic: 845 Message: 867

Hello Hubert,

What a great job you have done! They are lovely plots and just what I need. I tried simulating some with "Elsie" and the Cauer filters were no problem but it could not handle the tapped coils for the Chebyshev filters. I will make the changes to the default table and post them on the ghpsdr3-alex group.

868. Quisk on Atom Netbook

Yahoo group: n2adr-sdr
Date: 2013-02-17 21:17:56 UTC
From: Graeme
Topic: 868 Message: 868

Hi Jim,

I note you are planning a new release of Quisk having returned from skiing (Lucky man) and would like to request a change.

With the great improvement in recent versions in cpu demands I can now run Quisk beautifully on my Atom netbook. Only problem is that the screen is just too narrow (1024 x 600) for the smallest size window and the sliders on the RHS are off screen. I can move the window around but it is a bit clunky.

I wonder if it would be possible by slightly reducing the width of each button (plenty of space there to do this without losing text) to squeeze in the window to fit the 1024 x 600 Atom screen. It is already easy to make it bigger when working on higher resolution screens.

Many thanks for such a great Software and Hardware.

73 Graeme ZL2APV

869. Re: [n2adr-sdr] Quisk on Atom Netbook

I was on skype with G7VAC and saw the same effect on his laptop.
We tried adjusting the size of the quisk window all to no avail.
73 ... Sid.

Hi Hubert,

Just thought I would let you know that you need administrator rights to download the .sch files which I don't have.

I tried simulating some with "Elsie" and the Cauer filters were no problem but it could not handle the tapped coils for the Chebyshev filters. I will make the changes to the default table and post them on the ghpsdr3-alex group.

I will make the default filters to match your set except the bank 11 and bank 12 filters will need something to select them rather than the bank 2 and 3 when you want "contest filters". I will wait until you post your .pdf with the passband plots and finish the job then.

I would like the exact curves of the filters, as for example on 80M I switch from the through filter at 3.5 MHz to the 80M filter and at 4.0 MHz I switch back to the through filter. If I knew that the filter had its edges at say 3.4 and 4.1 MHz then I would alter the default setting for this.

871. New Quisk 3.6.7

Yahoo group: n2adr-sdr
Date: 2013-02-18 00:22:35 UTC
From: jimahlstrom
Topic: 871 Message: 871

Quisk Version 3.6.7 February 2013

I added a check for the correct wx version. Thanks to Mario, DH5YM. Selecting "Config/Favorites/TuneTo"
now changes to the configured default_screen instead of the waterfall screen. Thanks to Detlef, DL7IY.
The mute button and volume now controls only the radio sound, and not the digital output. Thanks to Mario, DH5YM.

Previously, Fldigi XML-RPC control only worked if a digital mode was selected and a digital audio device
was specified. Now it is always active unless you turn it off in the config file.

The transmit power level and the digital transmit power level can now be adjusted on the config screen. The
levels are a percentage of tx_level as set in the config file. The meaning of digital_tx_level was changed.
It is now the maximum percentage value for the slider. Thanks to Hubert, DG7MGY.

There is a new feature to save frequencies and return to them. When you have tuned in a signal of interest,
press the "Save" button to save the frequency, band and mode. Repeat for more signals. Now press "Next",
to switch to the next saved signal, and press "Next" repeatedly to cycle through the list. To delete a
saved signal, first tune to it with "Next" and then press "Delete". If you save a large number of signals,
right click the "Next" button, and you will get a popup menu so you can jump directly to a station. Thanks
to Detlef, DL7IY.

I had to renumber the columns for the Quisk buttons. That won't matter to you unless you add your own widgets
to the bottom of the screen by importing your own quisk_widgets. Then you will need to renumber your columns.
See n2adr/quisk_widgets.py for an example.

Hello,

The next version 3.6.7 is out. Please try this version and let me know if the problem is solved.

Hi Jim,

Firstly thanks for all the improvements and I just love the memory store facility. It works really well and is such a big help cruising around the band.

I have put a screenshot of Quisk running on my netbook at 50 to 55% cpu with no problems. It nearly fits now but has a few overlapping buttons plus the rit slider but nothing to stop normal use now. The screenshot is stored in the files section.

Hello Graeme,

Thank you for the screenshot, it was a great help since I don't have your notebook. The screen still looks a bit tight. The easiest way to fix it is to add another button row and put fewer buttons per row. I have not done this because I wanted to use the full screen width to make tuning easier, but a minimal height to make room for other windows, for example, a logging program. I will have to think about this a bit more.

Hello Graeme,

I added a new config file parameter button_font_size that can be changed to reduce the size of the buttons. The default is 10, but you can change it to 9 or 8, and the Quisk screen should fit your netbook much better. It will be in the next release in March.

If you go that route ... could you add 144, 220,440Mhz buttons ...

Hello Graeme,
also the QucsStudio *.sch files now are ready to download.
Yesterday I had too much to doo, and so did I could not do this right.

It is good to carry out simulations also with the AADE filter designer. QucsStudio are easy to handle but it calculate with ideal coils and so it differ on higher frequency.

;-) i know tapped coils are not so easy to describe, i have
the same problem on august last year at QucsStudio Michael DD6UM
added the tapped coils to QucsStudio.

73 thanks for your comment de DG7MGY Hubert

I would like the exact curves of the filters, as for example on 80M I switch from the through filter at 3.5 MHz to the 80M filter and at 4.0 MHz I switch back to the through filter. If I knew that the filter had its edges at say 3.4 and 4.1 MHz then I would alter the default setting for this.

Topic: 868 Message: 879

Thanks Jim,

That was a quick response and should be an excellent solution - roll on March :-) With the netbook screen resolution, smaller fonts are much larger to the eye than high res screens. There is no chance of displaying my log software at the same time as quisk on the netbook so I run it on the second desktop and flip between them or do the logging into my cell phone. Normally I use my main PC in the shack where everything fits onto one screen.

I must say I am having the best years of ham radio with the SDR's in over 50 years of being a ham. Many thanks for your part in this.

Topic: 845 Message: 880

Hi Hubert,

Thanks for making the files available for download. I have got them OK. I will try AADE filter designer as you suggest and see if it will run with wine. If not I can run it in virtual box where I have a Windows XP set up. It is the only Windows available to me.

The enhanced filters are a bit of a problem as I parse the list of filters to find the one that matches the frequency being used and of course in the case of 80 and 40 M bands there are two matches. What I am going to do is have a checkbox in QtRadio for "Use extended filters" so that when parsing the list of filters it will break at the first filter found if not checked and continue to the end of the list if checked and upon finding the second filter will overwrite the first found. Of course this means that the extended filters must occupy the last bank positions and if using glsdr will never use the extended filters if fitted although I will email Alex to discuss what may be done about this.

I am going to be away for the next 5 days so it may not be posted until next week.

881. Quisk support for RTL2832U dongles?

Yahoo group: n2adr-sdr
Date: 2013-02-18 20:55:12 UTC
From: irbsurfing
Topic: 881 Message: 881

Hi,
Just wondering if there any plans to add support to run the cheap RTL2832U dongles with Quisk please?
It would be nice to have a Python option.
Thanks,
Andrew

Hi,

i do not know what Jim intends to do but in general the easiest possibility would be to make use of the rtl_tcp server. I do that from time to time with SDR# and it works fine.
Are these USB sticks also used in the US ?
Do you know if there is a written document that describes the API of the rtl_tcp server ?

regards
Mario

There is also support in ghpsdr3-alex. I have used the dongle with a
2m/70cms colinear antenna with good results on 2m and 70cms.

Hi Mario,
Thanks for the reply, the dvb-t dongles using the RTL2832U / R820T or E4000 tuner are widely available in Europe as they are suitable for free to air tv transmissions.
I believe that the US does not broadcast a compatible standard and are therefore not so easily available but there are many oversea sellers on Ebay.
Here are some links to the major sources of data that should contain the required information:
http://sdr.osmocom.org/trac/wiki/rtl-sdr
http://cgit.osmocom.org/cgit/rtl-sdr/
http://superkuh.com/rtlsdr.html

I have used SDRSharp and HDSDR etc but just thought it would be interesting to use Quisk especially as I am getting (slowely!) to know Python.
Many thanks,
Andrew

From: Sid Boyce
Topic: 800 Message: 885

Today I had a look at the circuit again and realised that cutting the
ribbon cable wire to pin 7 was an alternative.

I am pleased to say that worked.
73 ... Sid.

888. Quisk Version 3.6.8

Yahoo group: n2adr-sdr
Date: 2013-03-13 23:46:45 UTC
From: jimahlstrom
Topic: 888 Message: 888

Quisk Version 3.6.8 March 2013

The new config file parameter button_font_size can be changed to reduce the size of the button font. This is useful for a netbook when the lower screen resolution results in crowded buttons.

There is a new button "Notch" for an automatic notch filter to get rid of carriers in SSB signals. It works in CW too, but is less useful because the sharp filters can get rid of unwanted signals. The "Notch" is an advanced feature based on the FFT and not the LMS algorithm.

889. Re: [n2adr-sdr] Quisk Version 3.6.8

Excellent Jim,
I'll give it a try later.
I always wished there was a notch filter in quisk. The one in qsdr is very effective.

From: dl2stg
Topic: 890 Message: 890

Hi,

QSDR 1.0 is available on http://dl2stg.de/stefan/hiqsdr/qsdr.html

Changes to Version 0.99.x:

* Installation packages available for Ubuntu 12.10 (32 and 64Bit), no need to translate the sources

* Client/Server, HiQSDR is now remote usable via internnet or wifi

* GUI colors configurable

* replay is seekable

* Many fixes and small improvements

73

Hi Jim,

Thanks for the release. I am busting to try it but will have to wait a bit as I am still in hospital following some heart surgery. Will report on netbook performance asap.

Hi Graeme,
I wish you a speedy recovery.

I tried it out and it's excellent.

I have been hunting for tuners of which they have been few today and
what were there were quite weak but they were silenced. Around 1/2
second before they were suppressed.
73 ... Sid.

Glad to hear you will be back home tomorrow.

The HiQSDR/Preselector is looking good.
I am getting a little over 5W PEP on speech peaks into the Lightning Bolt Quad and all set for on the air testing.

Last night I set AM mode into a dummy load and got Average Power on just carrier of 14W out on 20m and 12W on 10m.

I have a heatsink that just fits inside the enclosure and a 6.35mm thick copper heat spreader between it and the heat block.

I just need to make a cutout in the bottom cover so the heatsink can protrude.

I think I mentioned before that cutting the wire to pin 7 of the interconnecting ribbon cable got rid of the FDX and allows TX to work.
73 ... Sid.

897. HiQSDR on the air

Yahoo group: n2adr-sdr
Date: 2013-03-15 03:52:41 UTC
From: Sid Boyce
Topic: 897 Message: 897

First QSO's and Well pleased!
Been on the air on 20m and heard WP4AZT just giving reports but all the stations he worked were in USA.

Heard a local who is also into SDR and Linux trying to work him QRP. We couldn't get through so we chatted for about 1/2 hour.

I then got a call from Jay, NE2Q in New York but he couldn't copy Dave who was ready to go to bed anyway.

Jay and I had a QSO from 01:56 until 03:08 when the band seemed on the way out between us.

Jay was 59 when we started and 56 was my report. Eventually he went up to 59+20 with 100w and I up to 59+10 with <10W on the HiQSDR and quisk-3.6.8.
73 ... Sid.

I had caught up with the wire cut & have already read your next post. Congratulations on your qso's it is a great thrill. I have been working on qtradio & should soon have the selected filter showing on the hiqsdr panel plus checkbox for manual selection, extended filters and of course tx.

Thanks Graeme,
I am willing to test when you are ready.

The QSO with NE2Q was a pleasant surprise.

Thanks Andrea,

Still a bit slow but pleased to be back into it. For the short term I will fudge the filter setting from hiqsdr by polling it from QtRadio each time the frequency is changed. Later I will write communication initiated by hiqsdr which will be extended for swr, power, beam heading etc. but this is still dreamware. BTW I loved working on your code and at last there were enough comments for me to follow what was happening. The rest of QtRadio was hard to follow. Clever people doing clever things which may have been easy for them but was a mystery for me :-)

Hi Jim,

This morning I have set quisk-3.6.8 up on my netbook. I went down to a font size of 8 and apart from the "Audio" button everything fits. Some notes which I hope are useful to you....

1. Audio button is a bit squeezed still.
2. RIT frequency no longer obscured by slider :-)
3. Save, Next, Del buttons slightly cramped but text is clear. This mem store is a great feature. I use it all the time.
4. Overall window size slightly too wide for a netbook screen (1024 x 600) but I can centre it so the volume control and spectrum sliders just sneak in.
5. The CPU loading on the netbook ranges from 68% down to 57% and about every 5 mins or so there is a dropout while the audio tries to resync (I think) but otherwise runs flawlessly. Pretty amazing on such a tiny machine.

I have been using Quisk since your first version and wrote to you years ago where you were so helpful and encouraging and set me on the path to being an SDR convert. I have seen Quisk go forwards from year to year and just want to express my thanks and appreciation for your gift to the ham radio community.

The best code I have ever seen written was by AT&T, with comments far outstripping code so it was only necessary to read the comments most of the time. That made it easy to understand and work on.

A colleague told us he once came across comments in code that said "God and I used to know this code, now only God knows".

Hi Stefan,
Details of a problem I am having with Kubuntu 12.10 and Tom has made a recommendation to move to a different filter module at the end of the following email.

One problem I have on openSUSE where qsdr-1.0 starts up normally, when I move the mouse off qsdr or try some actions within qsdr, sound ceases until I close it and start again.
I shall gather any data I can, if I can and pass it on.
73 ... Sid.

Sid,

Have you tried using the filters out of the filter module, yet? Those
filters use VOLK for SIMD instead of the hand-crafted stuff that in
the gr filters. That might help. Besides which, we're removing those
filters, so moving to the new filter module will keep you more
compatible as we go forward.

Tom

Hi Sid,

the filters are already used from gr-filter.

If you have problems with audio, please increase in settings
Interconnect->audioBufferSize. 5000 or 6000 may be a good value.

Then get you the "unpaired unlock() call" error ?

73

Stefan

OK Jim,
I'll change the title of you email and send to the n2adr group so all interested parties can comment.

What we are seeing on the Preselector is CCTX permanently Low and causing the FDX LED to be ON.
Hitting PTT in quisk, it's background goes RED and TX does not function.

Severing the link between X1 pin 7 on the HiQSDR and X2 pin 7 on the Preselector circumvents the problem so that TX works.

Mario, Helmut --- appreciate your comments on this problem.

913. FPGA Pin57 & Pin56 explained

Yahoo group: n2adr-sdr
Date: 2013-03-28 19:17:42 UTC
From: Helmut Goebkes
Topic: 913 Message: 913

Hi Sid, Hi Jim,

sorry for late reply, but currently my head stuck fully in the
prototypes of the HiPPA (100W PA for HiQSDR) and the related circuits
(safety, tx-filters, RF switching, IM optimizing a.s.o)

BTW Jim, your new QUISK Version is really great! The notch works perfect and is a great enhancement! Also the other improvements makes QUISK really THE reference for N2ADR/HiQSDR.

PIN 57 @ FPGA is absolutely ok, this pin works correct and is used
for RX/TX-switching the preselector/MPPA and should not changed!

The pin Sid means, is the FPGA PIN56, wich is currently not in use.
To solve all Problems, best way is to set this pin to Output with
following function:
If Quisk is in "normal" operations, this pin should be "High".
If Quisk is switched to "Full Duplex" (FDX Button active)
this Pin56 (labelled CCTX @ HiQSDR) should go to low.

Info: If this pin56 is high, the preselector works normally.
If this pin goes low, the preselector is switched to a "Full Duplex" mode wich bypasses all filters and allows using HiQSDR with connected
preselector as VNA, RF Bridge connected to the separate RX/TX-SMA connectors @ Preselector.

Explanation:
Pin56 is pulled high to 3.3V normally in the preselector.
A unprogrammed Pin of the FPGA (like in current Firmware version)
should be in a high-impedance state.
The only HiQSDRs i know this pull-up to 3.3V does not work is Sid's and Marios HiQSDR. But shure, the best way to overcome such problems is to program the PIN56 as "Full Duplex Active" Output as mentioned bevor ;-)

Thanks Jim, Sid!

73!

Helmut, DB1CC

Topic: 913 Message: 914

Hello,

I will make this change in a new FPGA firmware version 1.4. It will also require a new Quisk version 3.6.9. Both will be available in April.

FPGA pin 56 is now an Output pin that is High for normal (not full duplex) operation, and Low if the FDX button is pressed and full duplex operation is in use.

Please check that this will not cause a problem with existing hardware that has a pullup resistor connected to pin 56.

I checked the FPGA code for version 1.3, and unused pins are configured as inputs will a weak pullup, so I don't understand why the pin would be low.

I am planning another change to FPGA version 1.4, but I will create a different message thread to discuss it.

915. New FPGA Version 1.4 with AE4JY SNDP

Yahoo group: n2adr-sdr
Date: 2013-03-29 19:19:24 UTC
From: jimahlstrom
Topic: 915 Message: 915

Moe Wheately, AE4JY has invented a Simple Network Discovery Protocol that enables you to query for Ethernet connected hardware, and set the IP address and port. It is extensible. See http://download2.polytechnic.edu.na/pub4/sourceforge/s/sd/sdrnetsetup/doc/SimpleNetworkDiscoveryProtocol.pdf

I plan to add his protocol to the FPGA firmware version 1.4. It will enable you to set the IP address of the HiQSDR to anything you want, and means you no longer have to compile and burn the FPGA to change IP addresses. Operation is automatic, and uses the existing address rx_udp_ip.

The protocol depends on a hardware name which I set to "HiQSDR-v1" and a serial number "1000". The name must not be changed. To support multiple HiQSDR on the network, you should change both the MAC address and the serial number each time you make a new HiQSDR.

I do not currently support changing the port or the MAC address.

Comments or changes?

Hi Jim,

THanks for help jim. I agree, i cannot also not understand why this two units have this problem - anyway, the firmware change is the best way. The pulllup resistor is 10K connected to the 3.3V power of HiQDSR and should not be a problem to drive for the FPGA. I made this as a future reserved function, but if you implement it now, this would be great!

Using multicast (instead of plain broadcast) would be preferable and
(maybe) even using network byte order.

Hi Jim,

How is the compatibility to older / different GUI Software
if you implement this SNDP Protocol? I did not read the Spec in full
but is there a "default" IP wich is accessible if any different GUI Software did not use/support this SNDP ?

Hi Jim,

i think it is a great feature, but this is a non-standard protocol, only usable with a special software on a host. The static IP is not a markable limitation and all old devices need a update, so it is also possible to change the IP for this devices on the old way. For new devices Helmut have to patch the fpga image to create unique mac adresses. The better solution is DHCP, but it oversized for FPGA.

Btw. i have put on my hiqsdr page a FPGA-Version sg4 with downloadable _complex_ fir filter taps for RX and TX at runtime. The double clock for the filters is removed, it is not stable in all cases. The default filters are the old from version 3. So nearly all signalprocessing for ssb or cw are running in the fpga. I use a rasperry pi for audio output with only 6% CPU usage. Next step is a nice display and some buttons to create a device, usable without computer.

From: jimahlstrom
Topic: 915 Message: 920

Hello Helmut,

The same default IP address is still in the FPGA firmware and this is used (just as now) if the PC software does not use the new SNDP. So everything will work with the new FPGA firmware and old or different software. Of course, when you burn the new 1.4 firmware, you are free to change the FPGA IP address, just as now.

If you have new FPGA firmware (version 1.4) and new Quisk software (3.6.9) then Quisk will attempt to change the IP address to the rx_udp_ip that is in your config file. But currently that is equal to the IP address in the FPGA, so nothing different happens.

The only time you will notice a change is if the FPGA IP address differs from rx_udp_ip. Previously that combination fails, but now the FPGA IP address is changed to equal rx_udp_ip, so everything works. This is meant to make it unnecessary to change the FPGA IP address when burning new firmware. It is also meant to make it easier to manufacture and sell HiQSDR hardware since you don't need to request the IP address from the customer.

Perhaps, but I don't know how to do multicast, and I am note sure how to set it up in the LAN9115 Ethernet chip I am using. Is there a real advantage to multicast? Broadcast requires almost no changes to the Ethernet code.

I agree about the network byte order. But I am trying to use the protocol as published.

I agree it will never be an Internet standard because DHCP fills the need. And I agree DHCP is oversize for FPGA. But DHCP is also insufficient because it only assigns an IP address (plus a lot of other irrelevant data), but the PC still needs some way of figuring out what address has been assigned to the HiQSDR. It needs a name service. Moe's protocol is very simple, provides the IP address and eliminates the need for the name service.

So far I know of three users for Moe's SNDP; me, him and the Afedri project; not quite a Standard yet, I guess.

> Btw. i have put on my hiqsdr page a FPGA-Version sg4

My hardware page points to your HiQSDR page, and lists your FPGA code before mine. I will make sure your new code appears properly.

I am making a page showing just the changes for the SNDP so you can more easily add it to your FPGA code if you choose. I will send it to you when the design is firm and everyone is in agreement.

Hi Jim, Stefan,

thanks for your explanation Jim,
If SNDP is an additional Feature and the existing parts are compatible, i think it is a good Feature - mainly if it it simple to implement as you mentioned. Standards are not always applicable and
-who knows - this will be a future "standard" ;-)

@Stefan
i checked your new firmware version yesterday evening and it works perfect! Congrats for your new extensions, a big leap for N2ADR/HiQSDR Project!

My work on the 100W-PA and the microcontroller for control all parts are in a good Progress - currently i am programming the PIC for
the safety / power metering / control / ALC andTX-LP switching.

best regards & 73!

Receiving multicast should be matters of configuring a further (and different) MAC into the hardware (according to the IP to MAC).

http://www.tcpipguide.com/free/t_TCPIPAddressResolutionForIPMulticastAddresses.htm

Really, the LAN9115 Ethernet chip supports even the hashing, so it is able to pre-filter multicast frames, but, again, probably it is not so useful when the processing is done in hardware.

Finally, without implementing IGMP the vast majority of benefits is lost, so, probably, it is not worth the effort.

From: Sid Boyce
Topic: 897 Message: 926

Hi Rune,
It was using openSUSE x86_64.

On the ODROID-X I can get quisk to run but no graph output. If I select waterfall there is graph but no waterfall and there is flutter on the background white noise which is a little distracting, otherwise OK.

The display problems are a wx problem.

That's using a 3.0.68 kernel which only supports 1 CPU with the Mali400 driver.

Hardkernel are working on the Mali400 driver for 3.8.5 but it's proving difficult. With 3.8.5 I would have the 4 CPU's online with the mali400 driver.

I've built and installed gnuradio and I have uploaded gnuradio_20130326-1_armhf.deb to box.com. I got an email from them saying I can set up a shared directory so anyone can download it rather than having to invite individual email addresses.

Right now qsdr-1.0.1 is compiling and I'll make a .deb when it's done. When installing the .deb's there may be pre-req packages called for - I didn't note them down, I just installed as I hit build failures.
I just hit a build failure so I'll have to fix the library path.

Running qsdr over ssh as the current 3.8.4 kernel that has no hdmi video
output.
Works fine with video and sound output on the openSUSE x86_64 box.

Tomorrow I'll bring up the 3.0.68 kernel and see how it runs on 1 CPU
with the mali400 driver and sound all on the ODROID-X.

BTW, qsdr-1-0-1_20130405-1_armhf.deb when installed, dumps the qsdr
binary in the current directory, you just have to move it to somewhere
in your PATH.

930. Odroid-X with HiQSDR recommend distribution?

Yahoo group: n2adr-sdr
Date: 2013-04-07 08:13:56 UTC
From: Hubert
Topic: 930 Message: 930

Hello group,
some days ago i have played with Odroid-X and HiQSDR.

Two points I have noticed it.
Once could not use the microphone from my headset (allways -90dB) and it was not possible for me to setup an audio loopback device with snd-aloop to work with Fldigi and Quisk in digital mode. (modprobe snd-aloop did not found the module, but the modulefile exist)

Distribution was Linaro Ubuntu Linux 12.04 LCD

Which distribution was recommended to run Quisk and Fldigi on HiQSDR?
What kind of difficulties can be expected?

Microfone and the audio loopback device for me are key points of using an Odroid board to build an standalone HiQSDR transceiver.
I think it's possible to fix this with an extra usb sound card.

Sid i think you have already some experience with an ODROID board what use you?

Many thanks 73 de DG7MGY Hubert

Hi Hubert,
Microphone sound -- I found some posts on the forum on this topic. The recommendation is to remove C33 and R29 from the ODROID.
http://forum.odroid.com/viewtopic.php?f=14&t=833&p=5484&hilit=microphone#p5484

Looking at the circuit diagram all that is doing is turning it from stereo to mono. There was also some mention about a kernel update but I don't know if the 2 are needed together to give an increased microphone gain.

A few weeks ago I tried merging the latest hardkernel max98090 kernel C and header files into 3.0.6x and 3.6.8x, no luck there.

I am running a 3.0.68 kernel which uses the mali400 GPU driver which allows quisk to work whereas without the mali400 support you can't copy a single CW character or SSB word.

The only quirks with quisk -- You see no spectrum on Graph, spectrum only on Waterfall,
-120dB is the lowest being displayed, so everything below that is not displayed and I had to use +10dB to see a reasonable part of the waveform on the waterfall display.

No waterfall --- it's a wx problem that I have not found a fix for.

3.0.6x kernels use only 1 CPU and powers down 1 - 3 during boot.

The latest kernel being worked on that would use the 4 CPU's and the mali400 is 3.8.5 and there is one problem with hardkernel UMP support that's proving difficult for mdrjr to solve.

3.8.4 builds with mali400 support but does not use the HDMI display, when X starts it complains about UMP.

With mali400 support, doing "apt-get upgrade" or "aptitude upgrade" may overwrite certain files and it attempts only to output to LCD so mali400-dev_2.1-13_armhf.deb mali400_2.1-13_armhf.deb xf86-video-mali_1.0.1-7_armhf.deb from mali_packages.tar.gz have to be reinstalled for HDMI to work.

I have built packages for gnuradio with gnuradio_audio.diff for HiQSDR support and qsdr-1.0.1. They are uploaded to box.com and later I'll send you invites to download them.

They all suffer from low Microphone gain, I'm only able to whistle the MPPA up to 1W on the ODROID-X.
73 ... Sid.

how was the microphone gain set?

To: n2adr-sdr@yahoogroups.com

Subject: Re: [n2adr-sdr] Odroid-X with HiQSDR recommend distribution?

Hi Hubert,

Microphone sound -- I found some posts on the forum on this topic.
The recommendation is to remove C33 and R29 from the ODROID.

http://forum.odroid.com/viewtopic.php?f=14&t=833&p=5484&hilit=microphone#p5484

Looking at the circuit diagram all that is doing is turning it
from stereo to mono. There was also some mention about a kernel
update but I don't know if the 2 are needed together to give an
increased microphone gain.

A few weeks ago I tried merging the latest hardkernel max98090
kernel C and header files into 3.0.6x and 3.6.8x, no luck there.

I am running a 3.0.68 kernel which uses the mali400 GPU driver
which allows quisk to work whereas without the mali400 support you
can't copy a single CW character or SSB word.

The only quirks with quisk -- You see no spectrum on Graph,
spectrum only on Waterfall,

-120dB is the lowest being displayed, so everything below that is
not displayed and I had to use +10dB to see a reasonable part of
the waveform on the waterfall display.

No waterfall --- it's a wx problem that I have not found a fix
for.

3.0.6x kernels use only 1 CPU and powers down 1 - 3 during boot.

The latest kernel being worked on that would use the 4 CPU's and
the mali400 is 3.8.5 and there is one problem with hardkernel UMP
support that's proving difficult for mdrjr to solve.

3.8.4 builds with mali400 support but does not use the HDMI
display, when X starts it complains about UMP.

With mali400 support, doing "apt-get upgrade" or "aptitude
upgrade" may overwrite certain files and it attempts only to
output to LCD so mali400-dev_2.1-13_armhf.deb

mali400_2.1-13_armhf.deb xf86-video-mali_1.0.1-7_armhf.deb from
mali_packages.tar.gz have to be reinstalled for HDMI to work.

I have built packages for gnuradio with gnuradio_audio.diff for
HiQSDR support and qsdr-1.0.1. They are uploaded to box.com and
later I'll send you invites to download them.

They all suffer from low Microphone gain, I'm only able to whistle
the MPPA up to 1W on the ODROID-X.

73 ... Sid.

what kernal are you using?

I had a brief email chat with Jerry Wong at Maxim .... and some cli commands to use to control gain and internal paths in the Max98090 ....

supposedly amixer will work correctly with kernal 3.8(or was it 3.9 -- i forget at the moment)
two examples he sent me

amixer get 'LINEA Mixer IN1'

amixer set 'LINEA Mixer IN1' on

KC7NOA

I forgot to run those commands on 3.8.4, shall do so later.
No additional mixer controls with alsamixer in 3.8.4.
3.8.6 doesn't boot ... I have a UART card on order so I can see the
early messages.

There are many files that need changing so copying recent max98090.c and
max98090.h into an older kernel is not enough as there are other API
changes that are included in the new files.

Hello Sid,
many thanks for answer my question.

I have found that the use of the ODROID is not easy to do with the HiQSDR.

If I understand you correctly, there is no distribution that is easy to use and suitable for beginners.Certainly it is possible for an experienced Linux user to adjust so it works well with the ODROID.

For me i wonder whether the ODROID is suitable for my purposes with the Hiqsdr. (I did not have an Odroid board and i am thinkig about to buy one)

Your packages are great, ease of use and save a lot of time.
But without a good base distribution it was a hard way to setup the Odroid and keep all packages up to date over a long time.

73 dear Sid
Hubert DG7MGY

There are Ubuntu images on http://www.mdrjr.net/odroid/mirror/ that can
get you started and I am also supplying images.
I am waiting on Pascal to get back to me to say if the image I uploaded
to his site works.
It should with minor mods mainly to suit his local network setup.
If all goes OK for Pascal we can then expose the image for download.

I recommend using at least a full-size 16GB SD card, not one in an
adapter, better still 32GB which will give more than an adequate amount
of storage.
I use a 32GB SD card, a 160GB USB HD, NFS mounted partition with 342GB
spare on a Ubuntu x86_64 box and I have another 500GB USB HD I could use
so I can keep tons of "rubbish" around if I want to.

The boards are powerful enough so software can be built directly on them
rather than having the complexity of using cross compiler toolchains
running on x86 or x86_64.

The main stumbling block as far as I am concerned is getting the Mali400
driver functional in at least kernel 3.4.6 and then to see if the later
sound driver will expose more mixer controls.
The Mali400 driver is key for me as that takes away the load that would
otherwise fall on the CPU's.

The Samsung Galaxy S4 has 8 CPU's and 8 GPU's and I am waiting to see
what plans hardkernel has for that - that's some serious power in a
small form factor board and I could give up PC's with a few of them and
reclaim a huge amount of shack space.

Hopefully we'll get there soon and the best thing after that would be to
get the ODROID specific kernel additions into the mainline kernel with
50 odd other ARM platforms so that a wider range of developers can work
on and maintain it so it will always be current.
73 ... Sid.

939. Quisk Version 3.6.9

Yahoo group: n2adr-sdr
Date: 2013-04-10 19:35:19 UTC
From: jimahlstrom
Topic: 939 Message: 939

Quisk Version 3.6.9 April 2013

The new config file parameter digital_output_level controls the sound level to Fldigi, etc. I fixed some small bugs in the Windows DirectX sound system.

When using the Split feature, Quisk can now receive on both the Rx and the Tx frequencies, and play them in stereo. When working DX, you can now hear the DX in one ear and the pileup in the other. I like the lower frequency signal to be left, and the higher one right. This is controlled by the new config file option split_rxtx that can be 1, 2, 3 or 4. See the file quisk_conf_defaults.py (as usual).

This version of Quisk supports the new features in my HiQSDR FPGA firmware version 1.4. If you are using Quisk to set your hardware IP to rx_udp_ip, please be sure that rx_udp_ip_netmask is correct. The default is 255.255.255.0.

Hello Sid,
many thanks for your replay. Exactly what I was looking for.
This is a good base from which I can start from.
I invite me only once download the source image and copy it to a memory card so I can play with the Odroid Board from Helmut.

Perhaps I have too much on the installed Ubuntu discouraged, we'll see.

941. VB-Audio Virtual Cable (Windows)

Yahoo group: n2adr-sdr
Date: 2013-04-11 17:12:19 UTC
From: Hubert
Topic: 941 Message: 941

Hello Group,
I have found an alternative to the VAC Virtual Audio Cable for Windows.

The whole is called VB-Audio Virtual Cable and from France.
(Virtual Audio MME, DX, WDM Device Driver XP, Vista, Win7 32/64 bits)
The license is Donationware and works good with Quisk and Fldigi.

Here is the link to the web page with the download link:
http://vb-audio.pagesperso-orange.fr/Cable/index.htm

Glad to hear it, I was messing around with a usb soundcard and a loop back cable last night but not having much luck.

943. Re: [n2adr-sdr] Quisk Version 3.6.9

Yahoo group: n2adr-sdr
Date: 2013-04-11 20:36:57 UTC
From: Sid Boyce
Topic: 939 Message: 943

3.6.9 up and running.
I noticed that I can now whistle the MPPA up to 10W immediately after installing FPGA 1.4, with 1.3-sg4 it was only 5W.

I have reconnected the cable to pin 7 of the ribbon cable between the HiQSDR and Preselector and the FDX problem is fixed.
73 ... Sid.

944. HiQSDR keying

Yahoo group: n2adr-sdr
Date: 2013-04-19 12:22:40 UTC
From: Sid Boyce
Topic: 944 Message: 944

Looking at Key_and_PTT-HiQSDR.jpg suggests that only a straight key
rather than a paddle can be used.

Am I correct?

I have a keyer based on the Curtis 8044 chip, it's TTL output as shown in
http://techdoc.kvindesland.no/radio/b2/20051213182854342.pdf

http://users.ox.ac.uk/~malcolm/radio/8044print.pdf is also another document.
73 ... Sid.

OK, answered my own question.
The dots and dashes are generated by the 8044 chip so connection is simple.
73 ... Sid.

946. another CLOCK frequency

Yahoo group: n2adr-sdr
Date: 2013-04-19 17:04:07 UTC
From: rolin791
Topic: 946 Message: 946

Hello people!
I have been experimenting with N2ADR project DDC tranciever.I use a variety of ADC. In my latest project I'm applied AD9649-80 with CLK freq 77.76MHz. I'm changed this value in quisk_conf.py v3.6.9 and in the FPGA v1.4 tranciever.v file--but QUISK work incorrect.
Pleas help me. See foto fnd video in my folder rolin791.
Thank you.

947. Quisk

HI Gents

I made my cable for the USB blaster today and are ready to install the latest firmware in my HIQSDR. I also installed Qusik and the other files that are needed to get Quisk for win to run. I can ping my HIQSDR from my computer but when i start Quisk it load but freez, nothing works.
I found that when using HIQSDR you need to set your sound card in conffile to Primary. What about the hardware I guess i missing someting in my default conf file. anyone that have a woring conf file for win ?

I have not the foggiest idea about Windows.

Have you got the Altera software installed?

Hello Rune,
probably you have installed the 64Bit version of python
Quisk are compiled as 32Bit.
Or a wrong playback device instead of "Primary Sound Driver" i use
"Speaker" as reported from "Quisk Config Sound"

With both packages Quisk are running well on my Windows 7 64Bit.
Python fÃ¼r Windows 32Bit Download:
http://www.python.org/download/releases/2.7.4/
http://www.python.org/ftp/python/2.7.4/python-2.7.4.msi

wxPython fÃ¼r Windows 32Bit Download:
http://wxpython.org/download.php
http://downloads.sourceforge.net/wxpython/wxPython2.8-win32-unicode-2.8.12.1-py27.exe

HI Sid
Yes i got the altera software installed and i have also programmed according to RV3APM info. When i selected the file and hit START it was a click in the HIQSDR and 4-5 RED LED`s that turned ON. I was also able to see the progres in the Altera Software and it say 100% completed. It was done in around 1-1.5 min. Next, i will now install guisk again and see.

Regards
Rune

OK Rune,
Glad it's all gone well.
When I started there wasn't a straightforward guide and I was flipping between Altera volumes to get some idea.

Eventually I found a command line way of doing it that was very easy so I have always used the command line to program the firmware in seconds.

HI

I unistall and install again according to your link but still same result. I am a litle confused about the conf.py file.

1. I made a copy of quisk_default_conf.py file and placed in My Documents.
This file is renamed to quisk_conf.py Do i need to use the DOT in front of the quisk_conf.py like this .quisk_conf.py ????.

2
From where do i copy what kind of hardware i am using ??? and do i paste that into my quisk_conf.py ???

3.
My version of XP is Norewgian and my folder is named Mine Dokumenter, in english it is the same as My Documents folder. I guess i need to rename my folder to English "version" > My Documents.

4.
When i start qusik do quisk load and look for what is in quisk_conf.py

I am a little confused about this.

Hello Rune,
if your HiQSDR response of your ping now it should run.
You are using the right python version also ok
For me looks like a problem with your config file quisk_conf.py

If you made a copy from your Linux .quisk_conf.py think about
the different coding and linefeed. The Windows file use not a dot at the beginning of the filename "quisk_conf.py"

1. No dot at the beginning
2. Create a new quisk_conf.py open it with the Idle-Editor and take all parameters from your Linux .quisk_conf.py to this file
Edit "name_of_sound_play" to your reported Soundcard now the same with "microphone_name"
3. Could be the problem ?

Ill send you a copy of mine Windows quisk_conf.py to your Mail address

From: jimahlstrom
Topic: 947 Message: 960

Hello Rune,

To see what configuration file is in use, go to the Status tab on the Config screen. The config file is shown. You must have a valid config file to run Quisk, and Quisk must be able to find it. You can specify the config file name with the -c command line option instead of using the default name.

If your default location in "Mine Dokumenter" is not found, please let me know so I can add another language to Quisk.

Please do not copy all of quisk_conf_defaults.py to your config file. You only put lines in your config file that are different from quisk_conf_defaults.py.

Jim
N2ADR

961. quisk vs qsdr

Yahoo group: n2adr-sdr
Date: 2013-04-28 00:09:34 UTC
From: Sid Boyce
Topic: 961 Message: 961

quisk --- PTT and output power creeps up to ~3W with no speech and on speech ~7W.

qsdr -- PTT, no output power without speech and on speech a little over 10W.

Has anyone else seen this? HiQSDR/Preselector/MPPA.

One W station reported that with PTT and no speech there was a background noise which disappeared when I spoke and from my SWR I thought I had an RF leakage problem but seeing qsdr looking perfectly normal I recognised it must be a software issue with quisk.

Only problem with qsdr is that occasionally sound goes and I have to quit and restart it. With qsdr-1.0.1 the problem is not as severe as it was with 1.0.0 where sound would quit in a few seconds.
73 ... Sid.

962. Sound Problem,s using Quisk V3.6.9 with Windows

Yahoo group: n2adr-sdr
Date: 2013-04-28 18:08:42 UTC
From: Helmut Goebkes
Topic: 962 Message: 962

Hi Group, Hi Jim,

i have severe Sound Problems unsing the new Quisk Version 3.6.9
under Windows 7 operating System.
The Sound is distorted, sounds like two Sound bugffers simultanously with some echoes, and a lot of scratches about every second.
Always if the scratches can be heard, the latency time (in Status) Drops drastically.
This is not a HiQSDR Firmware Problem, same behavour with Firmware 1.3, 1.4 and 1.4 from Stefan. But if you use QUISK 3.6.8 no Sound
distortions are found.

The Problem can be reduced for a Moment usinfg a different Output Sound sample rate, if switching to 16 Bit, 96 KHz, for about a Minute all is ok but then again the distortions and scratches are heard.
most scrtaches and distorstion are found if soundcard digitation is set to 44.KHz/16Bit, but again alll only with the new 3.6.9 Quisk, under 3.6.8 all ist ok.

Same behaviour found at the Installation of a friends Computer (DG3MDE) but - curios- sound on DG7MGYs Windows is ok!?!
DG7MGY tested also under Linux and found no Problems....

I tested only RX currently, but i assume that in TX the same problem exist

best regards & 73!

Helmut

Making it clearer, SWR is OK, it's only power output where I am seeing
the difference.

A closer look, with quisk ~3W PEP without speech, ~7W PEP with speech.

qsdr - 0W without speech and 12W PEP with speech.
qsdr occasionally loses speech and also freezes solid but not as
frequently on 1.0.1. It'll run for between a few minutes and many hours
before it hits a problem.

Yesterday qsdr ran for over 15 hours without a problem then failed twice
within 3 minutes.

Hello Sid,

I think the output with no speech is a result of the microphone automatic gain control. With no speech the gain slowly increases until it picks up noise. To test this, try speaking. The gain will drop and the noise should disappear, then slowly return. I haven't had a problem with this because I don't hold down PTT without speaking.

The point of mic AGC is to get a standard mic level for the subsequent clipping stages.

I can add a few parameters to the config file to control maximum gain and the rate of increase if you want. But removing mic AGC is unwise.

Hello Helmut,

There was a change in the last version that may be causing the problem. The change was needed because if you turn off power to the hardware, it left a zombie process under Windows. But I only detected the problem with quisk_vna under Linux, not with quisk.py.

I tested the newest version under Windows 7 and it works fine with these parameters:

latency_millisecs = 150
data_poll_usec = 20000

Try that, and let me know if it doesn't work.

Thanks Jim,
That is exactly what happens, if I speak immediately it's OK and
covering the Mic it drops to zero and creeps up to 3W when I uncover it.

Hi Jim,

thanks for the hint, looks good and works without problems now!

i had in my quisk_config.py:

latency_millisecs = 25
data_poll_usec = 10000

wich seems to be to short ;-(

968. Quisk Version 3.6.10 May 2013

Yahoo group: n2adr-sdr
Date: 2013-05-09 13:34:03 UTC
From: jimahlstrom
Topic: 968 Message: 968

I made some changes to my n2adr hardware and widget files. I increased the timeout for select() in the UDP code. I added a patch from David Turnbull, AE9RB, to make Quisk USB control work with the Peaberry. The problem was discovered and solved by ON7VQ.

Windows changes the Documents folder name for different languages, and has no standard way to find it. I added "Mine Dokumenter" to the list.

The AGC release time and mic gain control are now parameters in the config file.

I added some features from Christof, DJ4CM: additional color control, double click tune on favorites screen, and format changes.

It seems QUISK does nor change bands both under Linux (latest ubuntu)
and under windows (8 pro).
It stays under 40 meters even when it shows 20 m, there are the same
stations when tuning up and down!
How can I modify my config file to be able to listen on each band?

971. Ordering help please

Yahoo group: n2adr-sdr
Date: 2013-05-11 11:36:19 UTC
From: wa9sdj
Topic: 971 Message: 971

After recently discovering the joy of Quisk, further search led me here, all I can say is I'm quite sorry it took me this long to find! What a great project!

I'm anxious to get started with HiQSDR and would like to pass this list of parts to the group to make sure I've got a complete setup.

I believe all parts are available from http://www.technologie2000.de/?

Here is what I have gathered so far:

HiQSDR DDC/DUC-SDR Module, Built, ready-to-use
HiQSDR less noise switching regulator for HiQSDR
HiQSDR MPPA (10W-Medium Power PA) finished module, completely assembled and tested
HiQSDR Preselector complete built & tested
iQSDR Preselector Filter Module Panel, Teilbestückt / Partly built

I don't think the above comes with interconnect cabling?

SMA cable set for preselector set
Micro Match Flat Cable Connector for preselector

Anything I've forgotten? I'm also 100% Linux, any firmware loading issues etc to note?

Many thanks
Andy

WA9SDJ

Topic: 971 Message: 972

I'll retrace my ordering steps.

HiQSDR built and ready to use.
I initially used my own linear P.S +13.8V --> LM338 --> +6.5V.
The SMA cables for RX and TX I made up.
The flat ribbon cable for PTT and Key comes with the HiQSDR.

Next was the Preselector, partially built so I had to wind the toroids supplied as the capacitors were already soldered on to the BPF boards. The different wire sizes I ordered separately from Conrad Electronics but should be available from Digikey and other sources.

The flat ribbon cable between the HiQSDR and Preselector is supplied with the Preselector.
SMA cables I made up.

The 10W MPPA ready built is a direct plugin unit. I added a 1/4" thick copper heat spreader and a heatsink.

I have now built everything into a 300mm x 250mm x 50mm high aluminium case - Thanks to DG7MGY for the idea.
I included one of the SMPS, the same as Helmut supplies for the HiQSDR - I had 10 that I ordered quite a while ago from Hong Kong or China but wasn't sure whether they were suitable for the HiQSDR and they were being used to provide power to other stuff around the shack, USB hubs, USB hard drives, etc. where the wall warts had failed, then I saw Helmut was using them.

I made up a PTT switch from a push-to-make push-to-break switch without the knob, soldered a nut on the end to avoid having to push on a pointed shaft and it works great. With quisk, finding the mouse pointer and clicking PTT probably gave the impression I had nodded off several times during QSO's.

See Photos --> DG7MGY and Photos --> G3VBV.
73 ... Sid.

Do you mean so you have other choices than 48K, 96K, 192K, 240K,
384K,480K and 960K available under Config --> Config?

I think they have to be multiples of 48K with the HiQSDR and are common
samplerates used with Softrock etc.

What's the thinking here?

If I change CLK frequency on 80 MHz, have some decimation coefficient, when sample rate very close to 48 kHz.
In the quisk_conf-default was writed:
Quisk has a custom decimation scheme for each sample rate. The allowable sample rates
are the four SDR-IQ rates plus 24, 48, 96, 192, 240, 384, 480, and 960 ksps. Other rates
can be added.

But I can not do it.

I will remake my project on 122880 kHz. I wonder to experiment.

I didn't get the flat cable for key and ptt so you need to check that in case Sid was just lucky and they are not normally shipped.

The filtering is so good on the HiQSDR power input that I do not get any noise from my homebrew switching PSU even when out of its double shielded box.

I am in the process of installing the radio in a homebrew case including a preselector and 20 Watt Amp. Don't stint on the case as this great radio warrants a top job here.

May be I was lucky, I ordered very early on.

The DC-DC convertor is very small and I see no noise from it.

I have some spurs that appear on other gear also so it must be something in the shack from the array of gear and cables capable of putting out digital noise but I have not attempted to trace the cause.

With the case I have there should be room to take the 100W PA/LPF and a suitable heatsink.

The front panel looks a bit sparse and I'm thinking of adding the NETACTIVE and DUPLEX LED's ... looks like LED+ --> Resistor --> +3.3V, LED- --> NETACTIVE/, DUPLEX/.

Hi Sid,

I've been looking at the photos of your case etc. Great job! Still chopping metal on mine but it is going well. I thought I would take the external switching signals for Linear band change etc. via a DB-15 chassis socket and the ptt and key via stereo phone jack sockets. I like to use a foot switch which avoids the hunt for the button with the mouse pointer problem.

I have added some pictures of the construction so far so you can see what I am up to. They are in the Photos under ZL2APV

On the front panel I have Power switch, Power LED, PTT and Key on stereo
phone sockets.

On the left side, Ethernet and a small fan to draw heat off the FPGA.

The back panel a Ground post, Antenna socket, 2 pin Power socket and a
fuse holder in the +13.8V line.
73 ... Sid.

From: Helmut Goebkes
Topic: 971 Message: 983

Hi Andy,

for a complete TX you need:

HiQSDR DDC/DUC-SDR Module, Built, ready-to-use
HiQSDR less noise switching regulator for HiQSDR
HiQSDR MPPA (10W-Medium Power PA) finished module, completely assembled and tested
HiQSDR Preselector complete built & tested
iQSDR Preselector Filter Module Panel, Teilbestückt / Partly built

If you order all complete, all flat/power cables comes with the module at no cost.

Optional you can order:

Set of 2 SMA coax cables RG316 20cm with two right angle SMA male connectors for EUR 18.--

Heatsink 100x160mm,15mm thick black anodized, CNC drilled and tapped M2.5mm taps inkl. moujting material to Mount Preselector and 10W-PA onto it (not needed it you Mount the parts i a cCase of sufficient size, EUR 18.--

All Parts are shortly availeble from stock.
Ordering via www.technologie2000.de

Further news:

Currently the prototype of the HiQTR-10 case is ready. This case can hold all HiQSDR Parts Preselector / MPPA and additional modules and is
made of cast Aluminium, black powdered. The HiQSDR Parts are screwed on a 8mm ALU-mountingplate who serves also as heatsink.
All parts incl. Front and back Bezels are CNC drilled and decorated with a attractive self adhesive front foil to cover the Buttons and LCD. Size: 185mm x 85mm x 210mm deep

The fronbezel is precutted with holes for the new HiQGPIO.board to Support an LCD (2x16chars)/VFO Knob and several digital/analog signals to communicate.

100W-PA: (HiPPA)

Circuit works and pretests are ready, Layout is in Progress.
Circuit diagram follows the next few days.
Some Infos before:
Push-Pull Power Stage with 2x Mitsibishi RD100HHF1, Bias controlled by two 10Bit ADC, DC Input currents into the FETS measured precisely by two precisie and fast hall current sensors, digitized with 10 Bit.
Dynamic bias Adaption via Software. Input has Software controlled attenuator 1/2/4/8 dB, Input power is measured and controls attenuator
Input frequency and Signal is detected by PIC and used to Switch TX filters and used as RF-VOX. TX Filters selected automatically via internal PIC (18F67K22) Output Power / return are measured by a precise compensated Bruehne Bridge followed by 2 AD8307 LogAmps.

his directial Signals are sampled 10Bit wide every 1mS to get a real PEP Hüllkurve. Two antenna realys allows antenna selections.
Sources to antenna can be HiQSDR direct (50mW) MPPA (10W) and Output of HiPPA (100W), Outputs for controlled FAN, galvanic isolated USB to PC (optional). Key, PTT, ALC connectors on backbezel.
Controls and connections to HiQGPIO are provided to
connect Display/Frontpanel. All necessary connectors are on PCB
to mout PA directly on the Backbezel of HiQTRX-100 case for cooling.

ok, thats for short. Circuit digs an layout follows in a few days to the list.

best regards & 73!

Helmut, DB1CC

btw. to Jim, N2ADR: Thanks for the new super Quisk Version!
Works perfect! Quisk can be used effectively by a touchscreen-PC

Thanks to all for the help!

Helmut, I'll be sending you an Email to get all of this ordered, including the optional SMA set and heat sink.

I look forward to the case and 100 watt amp as well.

73 to all.
Andy

Nice work Graeme and good descriptions.
What's the case dimensions?

I thought about a ferrite choke but the Lighning Bolt Quad has a 1:1
balun at the feedpoint where all the band elements are joined together.

I am also concerned about how hot the FPGA gets. The original box just
for the HiQSDR had the fan placed above the FPGA that kept it cool.

In the large case I placed the fan adjacent to the FPGA and I need to
order some heatsink glue from RS Components so I can stick on a heatsink
recovered from an old motherboard chipset.

The 3/8" thick heat spreader between the MPPA and heatsink -- I don't
like heat when it comes to electronics.
I am also looking to heat sink the DC-DC convertor chip and find space
for another small case fan I pulled from an old Sky TV box - one push
and one pull.
Fans are 12V run from 6.5V to keep the noise down.

Having fun and getting good reports even from as far away as ZL with the
MPPA, no competition for the big guns when a pileup is in full swing.
73 ... Sid.

Hi Helmut/ Andy

I understand you soon release the custom build Box/Cabinet for the
HIQSDR and preselector. Will there be space for the 100 watt PA ?.
When will the cabinet be ready for "my" paypal account :-)
You mentioned las summer somehing about
DSP No need for PC, is that still in you plans ?.

987. Housing the HiQSDR

Yahoo group: n2adr-sdr
Date: 2013-05-12 19:00:07 UTC
From: Graeme
Topic: 987 Message: 987

Hi Sid and all,

I was starting to drift away from the discussion on what to buy and consider when buying HiQSDR boards and accessories so decided to start another thread on case constructing and interconnecting so I did not become a hijacker :-)

Your comments from other thread Sid are copied here for continuity.

Common mode chokes at the shack end are useful and often give noticeable noise reduction. There are some really good articles on the internet and w8jk has some good stuff. I also have them on telephone and ethernet cables. Type 43 mix in ferrite tubes work well for me.

The pin grid heatsink on my fpga is stuck on with double sided adhesive thermally conductive silicon rubber. It works well and I have used the same technique with the DC DC psu by soldering a copper tab to the IC and earth plane and the silicon rubber sheet prevents electrolysis between the copper tab and aluminium case.

I have built the case from 3mm Aluminium with heat sinks on most things where applicable and want to keep it fanless.

I am looking forward to being completed and would like to arrange a qso with you when done so we can have a maximum distance qso as we are at each others antipodes.

Not at my shack at present so will send case dimensions later.

73, Graeme ZL2APV

Nice work Graeme and good descriptions.
What's the case dimensions?

I thought about a ferrite choke but the Lighning Bolt Quad has a 1:1 balun at the feedpoint where all the band elements are joined together.

I am also concerned about how hot the FPGA gets. The original box just for the HiQSDR had the fan placed above the FPGA that kept it cool.

In the large case I placed the fan adjacent to the FPGA and I need to order some heatsink glue from RS Components so I can stick on a heatsink recovered from an old motherboard chipset.

The 3/8" thick heat spreader between the MPPA and heatsink -- I don't like heat when it comes to electronics.
I am also looking to heat sink the DC-DC convertor chip and find space for another small case fan I pulled from an old Sky TV box - one push and one pull.
Fans are 12V run from 6.5V to keep the noise down.

Having fun and getting good reports even from as far away as ZL with the MPPA, no competition for the big guns when a pileup is in full swing.

73 ... Sid.

Thanks Graeme,
I'll need some rings that are large enough to fit over the PL259 and the RG213 coax.

I ordered a couple of 30mm x 30mm adhesive pads off EBay earlier, RS Components were talking serious dosh for 100mm x 100mm sheets and even smaller ones.

On the DC-DC PS looks like the copper strip is soldered to the IC tab and the adhesive pad is between that and the case with the copper strip secured by 2 bolts ... OK?

Sure, it would be fun to have a HiQSDR to HiQSDR QSO, better still a DX QSO.
73 ... Sid.

989. Case for HiQTRX-10

Yahoo group: n2adr-sdr
Date: 2013-05-12 21:44:51 UTC
From: Helmut Goebkes
Topic: 989 Message: 989

Hi Group,

as described yesterday i loaded some photos as first Impression of the new HiQTRX-10 transceiver case on he Photo board.
You will find the pics in the DB1CC_HIQTRX board.
This is a zero fan contruction, even under full time 10W operation!
Powerd by 13.8V, current consumption 0.75A during RX and 2.7A during 10W TXing.

More information and mechanical details following soon!

73!
Helmut, DB1CC

991. HiiQSDR / HiQTRX information

Yahoo group: n2adr-sdr
Date: 2013-05-12 22:28:25 UTC
From: Helmut Goebkes
Topic: 991 Message: 991

Hi Rune
nice to here from you after a while!

There are two cases available in the future, one for a
10W-QRP-Trabsceiver (called HiQTRX-10)
wich is shown in the photos i currently uploaded into
the DB1CC_HiQTX Photo board and a bigger one for the HiQTRX-100.
The bigger one with the 100W-PA is ready, but i am working still
on the 100W-PA. It takes a long time to make a good and reliable
100W-PA with all additional parts/filters/measurement parts a.s.o
and the software to protect the PA during all operating circumstances.

Also under development is firmware add-on for the FPGA to communicate with the PA/front bezel (HiQGPIO) so that HiQSDR can react on
front panel / PA or safety events.
Currently the 100W-PA Layout is in revision 2 (4-Layer Multilayer)
and fits directly onto tha back bezel of the larger HiQTRX-100 case and its heat spreader.

Sure the work was estimated to be done some month before, but unfortunately i had a couple of month in a hospital and there the
resources, time and effort for developments
are only sparingly available (grin).
But now all is ok again so i can start over :-)

The HiQTRX-10 case will be available very shortly (couple of weeks) and the 100W-PA / HiQTRX-100 case is estimated late summer.

Stefan (DL2STG) is currently developing an very fine solution for a PC less HiQTRX station, currently we are work together in developing the necessary hard/software.
More information coming soon!

best regards

Helmut, DB1CC

993. Re: Housing the HiQSDR

Yahoo group: n2adr-sdr
Date: 2013-05-13 00:39:49 UTC
From: Graeme
Topic: 987 Message: 993

I took the plug off the coax to slip the rings on and crimped another on when done. Cost me a connector but the noise reduction was worth it.

I made a mistake with my reference to w8jk which is of course related to an antenna design. The call I should have used is W8JI and his site is a mine of sensible information. Common mode stuff here.
http://www.w8ji.com/verticals_and_baluns.htm

It was NZ$15 (about 6 pounds) for a 2 sheet pack of 100 x 100 thermal si rubber with adhesive both sides.

I have added a couple of photos to my ZL2APV folder to show some common mode chokes I use. The first is a series of tubes with a total impedance of approx 700 ohms at 3.5 mHz. Need more tubes if on 160 M as ideally a Z of 1 K ohms should be aimed for. The second shows a pair of chokes with 2 1/2 and 3 turns respectively wound with RG-316 and good for 100 W even with a fairly high swr. The ferrite sleeves diam 16 len 29, are NZ$7.90 for a pack of 6. The ones to slip over RG-58 are $NZ6.90 for a pack of 6.

You have the method for securing the copper heat sink to the aluminium pad 100%. I made the copper sink from a small length of 1/2" copper pipe split lengthwise and flattened out.

I look forward to our first HiQSDR to HiQSDR QSO but more construction needed at my end.

From: Graeme
Topic: 989 Message: 994

Hi Helmut,

That is a case to be proud of and gives excellent access to all the components with all the heatsinking you could wish for. I am building my own case so I can save my pfennig for the linear when you are finished. I may have to push my project so I can be ready for your release.

Thanks Graeme,
I was thinking of a number of toroids to make a sleeve balun.

I'll have a good read though the balun at the feed point should make sure there are no common mode currents on the RG213.

Looking forward to that QSO.

In the early hours of this morning there were a group of VK's working Stateside and each other on 15m, most between 52 and 54 then there was one who spoke only briefly and occasionally as he said he was doing some work on the computer.
He didn't say his callsign but I bet it was Ian, VK3MO with that big 59+ signal as usual and seemingly at any time of the day or night.
73 ... Sid.

Hi Helmut,
In the photos I see you have done something I have been thinking about, filtering the output of the DC-DC convertor with windings on the toroid for both the + and - and a number of bypass capacitors before and after the windings.

Was that done as a precaution or because of measured noise?

Yesterday I was watching a Ti video dealing with power supply noise injected into systems. It made me think more about SMPS filtering.
73 ... Sid.

999. Input Filter on HiQTRX-10

Yahoo group: n2adr-sdr
Date: 2013-05-13 14:46:42 UTC
From: Helmut Goebkes
Topic: 999 Message: 999

Hi Sid,

The (big) toroid and the filter caps you see on the small
proto board serves to hold any external rf away from the
internal circuits and is connected directly to the DC Input
of the HiQTRX-10. There is no filtering necessary between
the DC converter and HiQSDR as long as it is not located
physically near the RF parts of Preselector or HiQSDR.
I have no disturbances in the spectrum even operated with the
small cheap DC converter. Of course, i soldered two ceramic caps
(100n/10n) at the Input and Output (the modules provides solderpads for them!) The
switching module is a low frequency one (250KHz)
and operated in the middle of the operating range (7V/1A @ output)

If i operate the HiQTRX as driver for my Expert-1K PA i got with
about 8 Watts input @ the Expert-1K about 600 Watts PEP.
That is a lot of RF and produce strong fields so the chance for
a stray induction of rf into the DC leads are possible so
filtering the DC input is mandatory.
(even correct grounding the case....)

73!
Helmut

Thanks Helmut,
Understood, by it's position it looked on the picture as though it was for the DC-DC convertor.

I have an external toroid with a few turns in the +13.8V line.
73 ... Sid.

Hi Helmut

Thanks for all this info, i just checked your pictures and this looks realy proffesional. I understand that there is a qrp and 100 watt housing. I will stand bye for the 100 watt version. Also the 100 watt PA and PC les option is interesting. Will the PC less version also work using the Computer in combo?. Thansk again for this news.

1002. HiQSDR TRX controls

Yahoo group: n2adr-sdr
Date: 2013-05-17 22:06:18 UTC
From: Graeme
Topic: 1002 Message: 1002

Is there any info on the trx controls for HiQSDR? In particular what is the function of the RX ACTIVE, CCTX, CCRX and the signal being fed back into pin 9 of X1.

Are there any facilities for tx delay on cw so the tx changeover relay stays in between inter-letter pauses or do I need to pulse stretch the tx_on signal?

I am sure there is documentation on this but not sure where to look. I want to drive my old softrock linear for a little ZL fun contest on 80M QRP tonight.

73, Graeme ZL2APV

1007. Re: HiQSDR TRX controls

Yahoo group: n2adr-sdr
Date: 2013-05-19 21:55:16 UTC
From: Graeme
Topic: 1002 Message: 1007

Sorry to reply to my own post but I am sure someone must know what the signals are and if they are inputs or outputs and their function. I can get a very good idea from looking at how they are connected to the preselector board but not the full specifications.

For example the ANT_SELECT signal (pin 6 of X1 or pin 57 of FPGA) does it operate before the TX RF is generated to allow the changeover relay to operate and avoid a brief no load spike?

The CCTX signal (pin 7 of X1 or pin 56 of FPGA) what is its function? I see it has a pullup resistor so probably is open collector and also is "anded" with ANT_SELECT on the preselector but do not know why.

The CCRX signal (pin 8 of X1 or pin 55 of FPGA) seems to be an input but again what is its function?

I need this information so I can design my RX/TX changeover system and if any of the delays and sequencing are already built into the HiQSDR I do not want to duplicate this in hardware.

I would be grateful if someone can help me here. Surely someone knows the answers to this. I did my little fun contest over the weekend and as it was QRP I used the ANT_SELECT signal for my antenna changeover relay and did not worry about switching spikes if the RF was there before the relay changed over, but for 100 watts it is a different story.

1008. Re: [n2adr-sdr] Re: HiQSDR TRX controls

Yahoo group: n2adr-sdr
Date: 2013-05-20 01:24:59 UTC
From: Sid Boyce
Topic: 1002 Message: 1008

The pullup resistor R51 was intended to pull pin 7 to a High with the
FPGA pin feeding it floating (Unused).
On Both Mario's and on my Preselector, Pin 7 was presenting a Low which
made FDX permanently come on and prevented switch to TX.

Mario cut the track at RN1 but I cut wire to Pin 7 (CCTX) in the ribbon
cable, both actions allowed switching into TX.

With the new FPGA 1.4 firmware the FPGA pin 56 was programmed High,
allowing the cable to be reconnected and TX switching to work.

In G3VBV --> Files folder, HiQSDR_PTT.* was how I first used a level
shifter (for N1 read X1) to drive a PTT relay.
After a while it was slow in releasing (~30 seconds) then it stopped
working altogether and the HiQSDR was sent to Helmut to replace RN1
(Some mishap here no doubt).
73 ... Sid.

Definitely Graeme,
Perhaps an update and completion of the control doc by Mario.

Briefly yesterday I checked my keyer which I hadn't used since 1985 when my brother was newly licensed in Canada and was restricted to CW for the first year.

I only checked ~25 WPM and there was much relay clicking but the side tone was OK, only afterwards I thought I should have checked to see how it would perform at 45 to 50 WPM.

I'll check again later at higher speeds whilst monitoring on another RX.
73 ... Sid.

Heehee I can't send over 25 reliably but the antenna changeover relay operated with every dot and dash. In the end I made a pulse stretcher for the Tx changeover signal and the relay only flicked over during the inter word pauses.

Yes Mario's control doc is very useful but aimed at the programmer who is communicating back and forth between an sdr and the HiQSDR and does not address the hardware interfacing - yet?

From: Helmut Goebkes
Topic: 1002 Message: 1012

Hi Graeme,

sorry for late reply but i am currently very busy.

Sid cleared the most important things already but here is the rest:

Preselector X2, Pin6: RX_ACTIVE: High in RX, Low if HiQSDR is TXing.
This is true for aöö modes, that means that for every dot of a CW
Signal this signals goeasto low. Internally, Preselectot / MPPA uses this Signal to Switch from RX to TX path and operates the changeover Signal. To Change to a CW delay, this Signal has to be changed in Firmware in FPGA to make a (adjustable) delay to avoid changesover relay release during CW Operation (should be operating mode dependant).
I will contact Jim for that problem.

Because i do not use CW, i did not recognize this as a problem ;-(

Preselector X2, Pin7, CCTX: Original designed for future use (CCTalk TX, a Serial Protocol) this Signal is redefined to be the "Full Duplex" Signal.
Always active if the preselector is switched via Software button
to the "Full Duplex Mode". Switches also the Preseleczor to full Duplex, that means, RX and TX pathes are separated and routed to the two separate SMA connectors on the rear.

Preselector X2, Pin8: CCTX: an Output from Preselector, Input to FPGA, Original designed for future use (CCTalk RX, a Serial Protocol) Not used, reserved for future use. To meet Levels of the 3.3V-Logic, the Signal has a resistive divider on preselctor.

Preselector X2, Pin9: This is a 3.3V voltage source from HiQSDR.
Used only as 3.3V source for the pull-Up resistor R51, 10K.
The Pull up Server to hold Pin7 in a defined 3.3V-Logic-high
to allow correct Operation of the "Full Duplex Signal" if FPGA
is equipped with older Firmware <1.4.

Hope this helps!

HAMRADIO 2013:
From 28th to 30th of June 2013, i am @ the HamRadio Exibition
in Friedrichshafen, Germany (A1, E509, Technologie 2000 GmbH).
I would be happy to meet-and-greet with Group members or
HiQSDR interested users!

best regards and 73!

Helmut, DB1CC

Hello Helmut,

Many thanks for your reply and don't worry about being late as this is a hobby and some things need to come first.

Your explanation is very clear and I will appreciate it if you would discuss the cw timing issue with Jim. It would be very nice if a parameter "CW_Delay" could be placed in the .quisk_conf.py file with a range of say 0 to 50 mSec. This will allow the operator to set the timing so that inter letter spaces up to inter word spaces if desired do not operate the relay. On full break-in cw it is usual to have the radio go to receive on word pauses or even letter pauses.

I had a problem with my softrock where the RF was applied at the same time as the relay changeover signal which meant the RF was applied to the Linear while the relay contacts were traveling and the swr protection saw an open circuit antenna and consequently shut down the rig. I wonder if there is a settling period for the relays to changeover before RF is applied. Conversely on receive the RF needs to be stopped from the TX before the relays release. I suspect the mechanical delay of the relay will hold the contacts closed even if RF and relay release signal occur at the same time. Probably these points have already been considered but I bring it to your attention just in case.

It is a simple task to pulse stretch the RX_ACTIVE signal in hardware if the software modification is messy.

I could see that Preselector X2, Pin8: CCTX: was a level converter signal but had no idea of its purpose. For level conversion on my preselector i am using the 74LVC4245 chip which is a 3.3 volt to 5 volt octal converter but of course will need to do the same as you to go the other direction.

Danke sehr.

73, Graeme ZL2APV

Hi Graeme,

The preselector takes care of the correct sequencing of antenna and PA changeover.
the relays are activated first and then the power to the MPPA is activated with a short delay
(approx 10-15mS). To control an external PA, low active open collector signals provided on preselector connector J3 (8 pin MicroMatch)

(Pin5: TX_ON/ can be used to switch external antenna/changeover relays)
(Pin7: PA_ON/ can be used to enable an external PA, this is a short delayed signal derived from TX_ON/)

both open collectors can drive max 50V/100mA, but no inductive loads directly (!)
(Switching transistor is BCR148W, see data sheet
http://www.infineon.com/dgdl/bcr148series.pdf?folderId=db3a30431400ef68011406f3ddb1012e&fileId=db3a30431428a373011440144ad602b8

best regards & 73!

Helmut, DB1CC
